2. Higgs “pole” near the superfluid-insulator transition in 2 dimensions
3. Quantum criticality and conformal field theories
4. Holography and the quasi-normal modes of black-hole horizons

# Spinning electrons localized on a cubic lattice

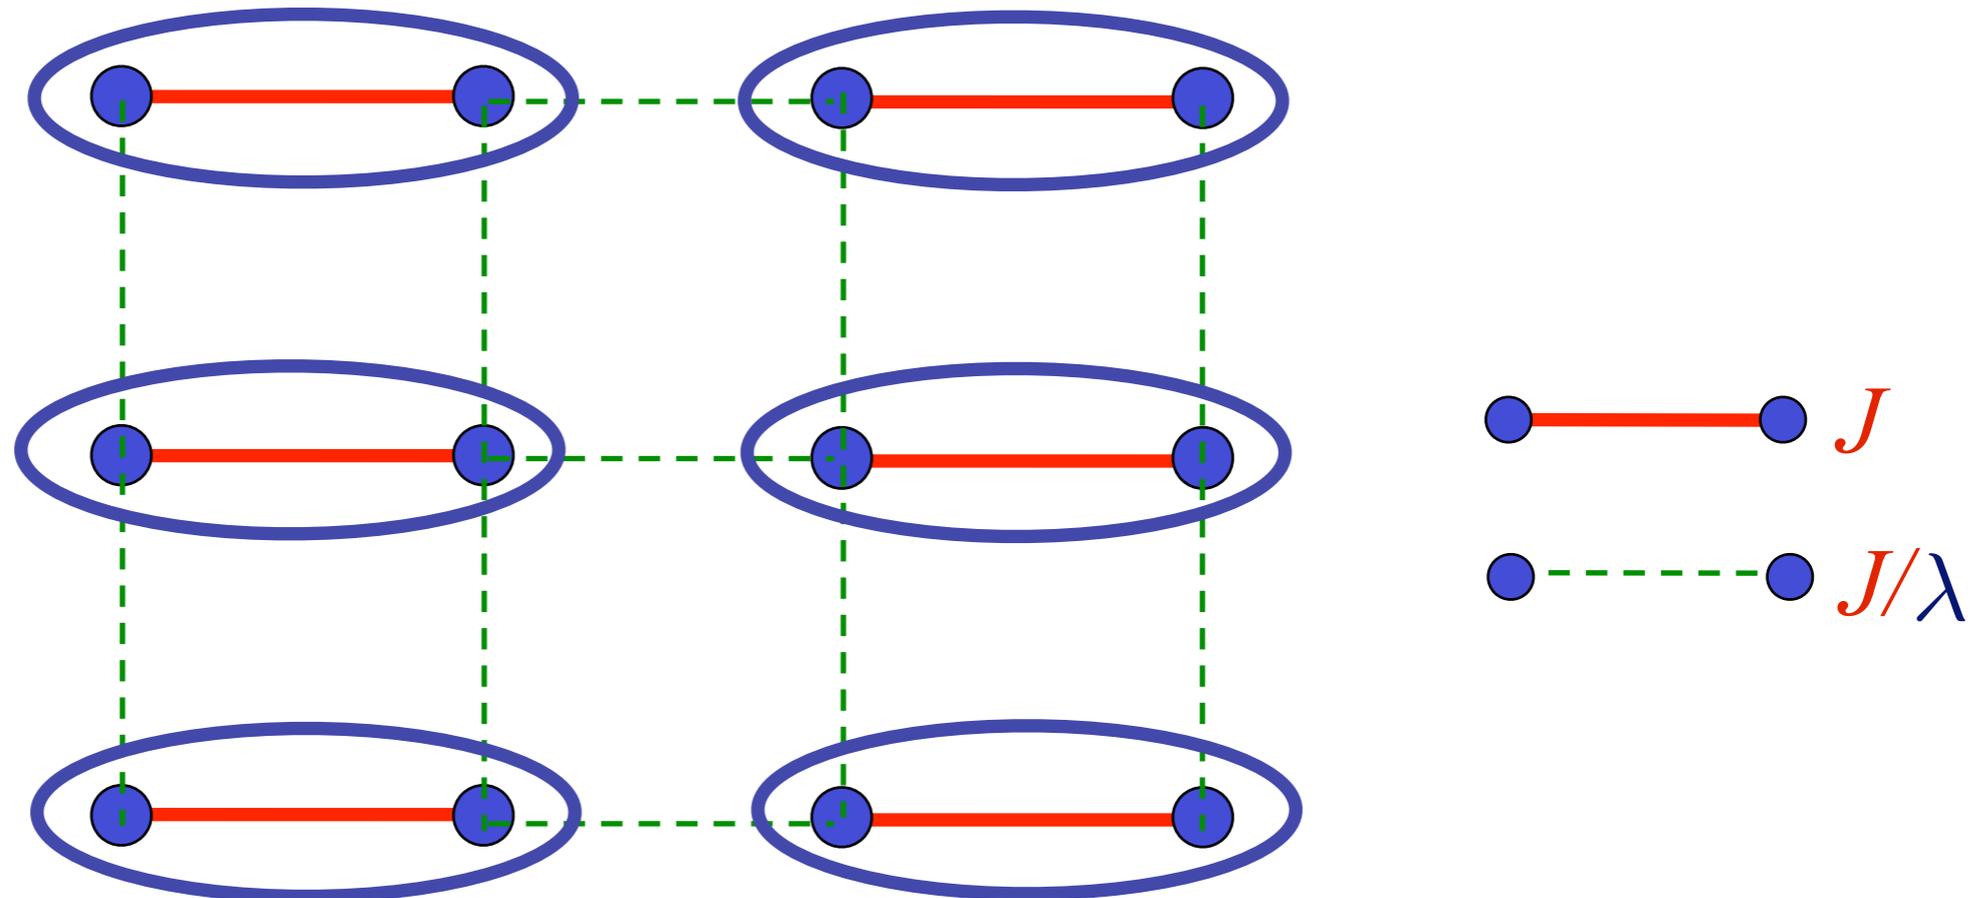

$$H = \sum_{\langle ij \rangle} J_{ij} \vec{S}_i \cdot \vec{S}_j$$

Examine ground state as a function of  $\lambda$

# Spinning electrons localized on a cubic lattice

$$H = \sum_{\langle ij \rangle} J_{ij} \vec{S}_i \cdot \vec{S}_j$$

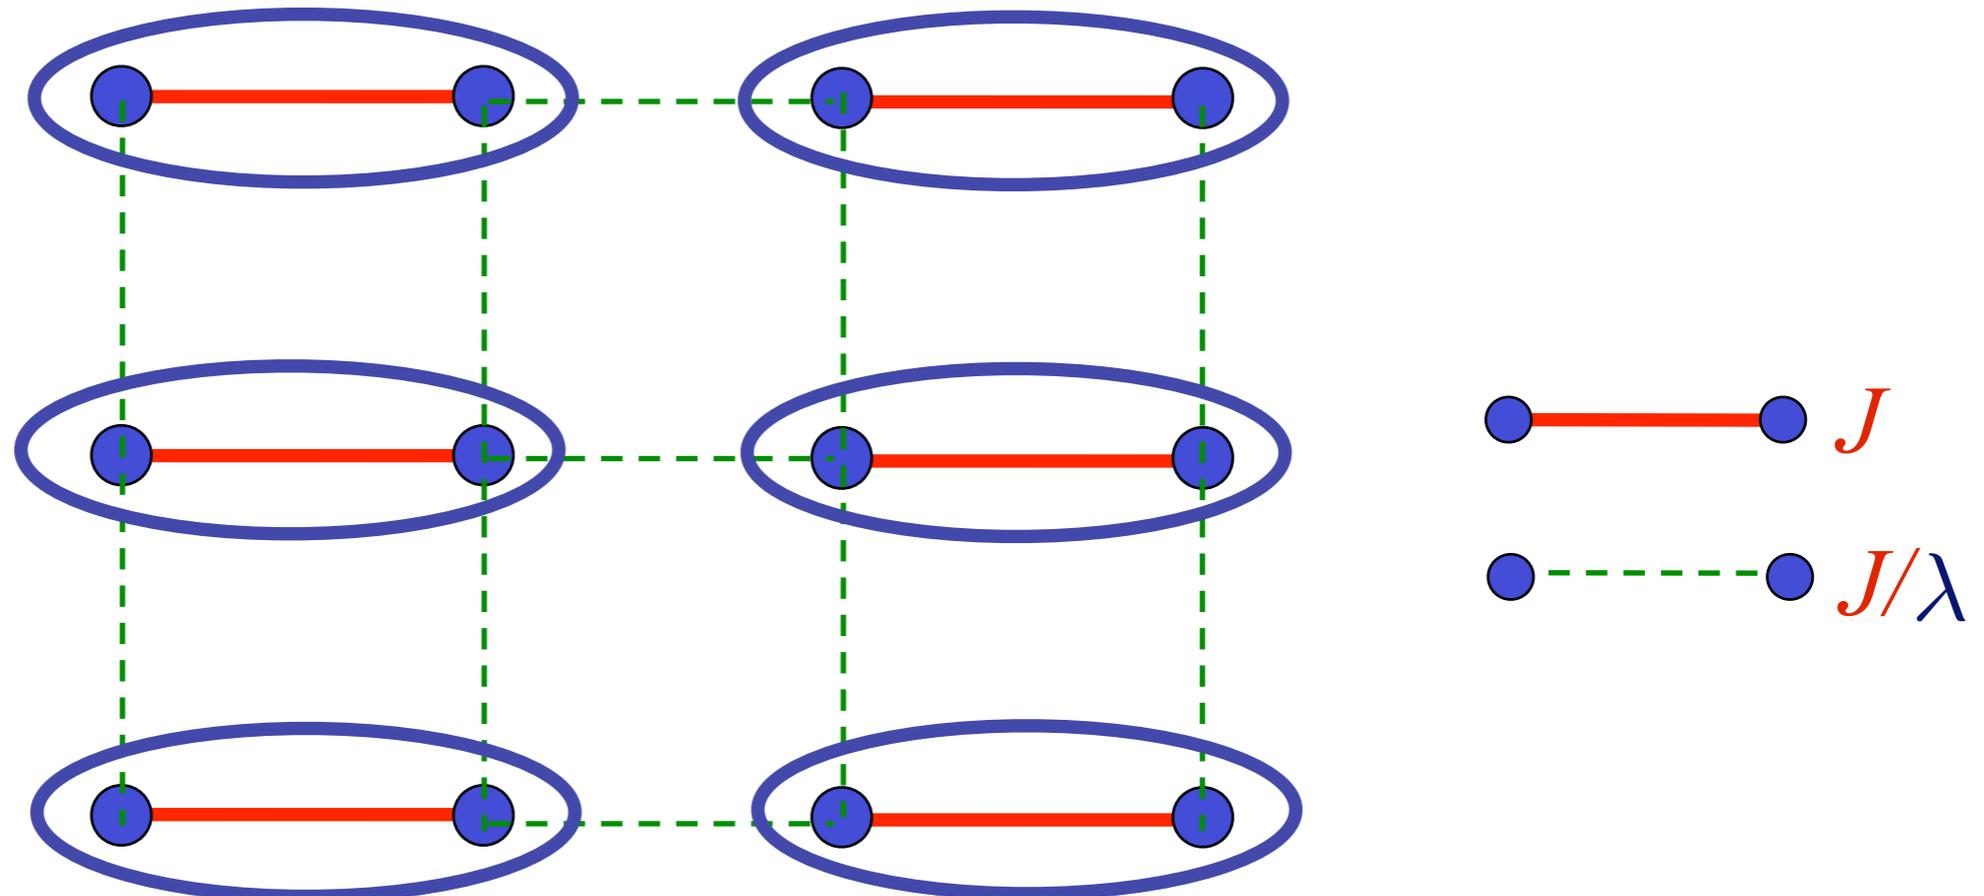

$$\text{[Diagram of a pair of spheres in a blue oval]} = \frac{1}{\sqrt{2}} \left( \left| \uparrow \downarrow \right\rangle - \left| \downarrow \uparrow \right\rangle \right)$$

At large  $\lambda$  ground state is a “quantum paramagnet” with spins locked in valence bond singlets

# Spinning electrons localized on a cubic lattice

$$H = \sum_{\langle ij \rangle} J_{ij} \vec{S}_i \cdot \vec{S}_j$$

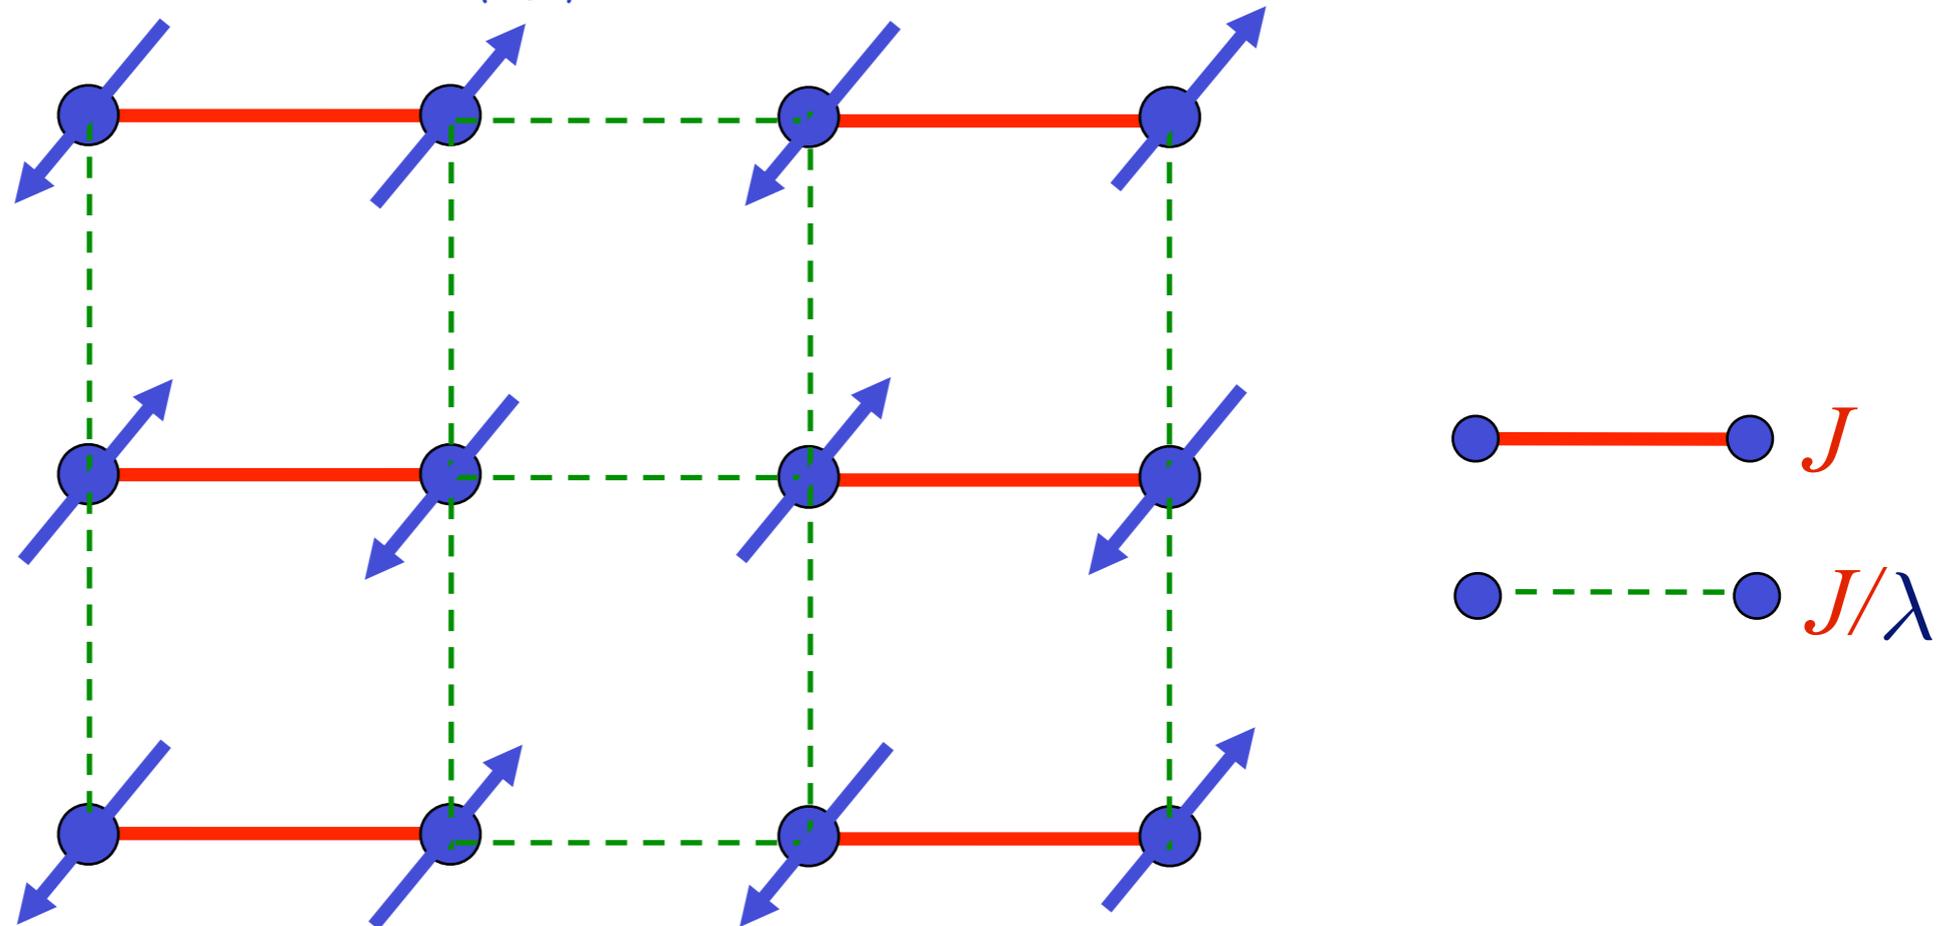

$$\text{[Diagram of a site]} = \frac{1}{\sqrt{2}} \left( |\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle \right)$$

Nearest-neighbor spins are “entangled” with each other.

# Spinning electrons localized on a cubic lattice

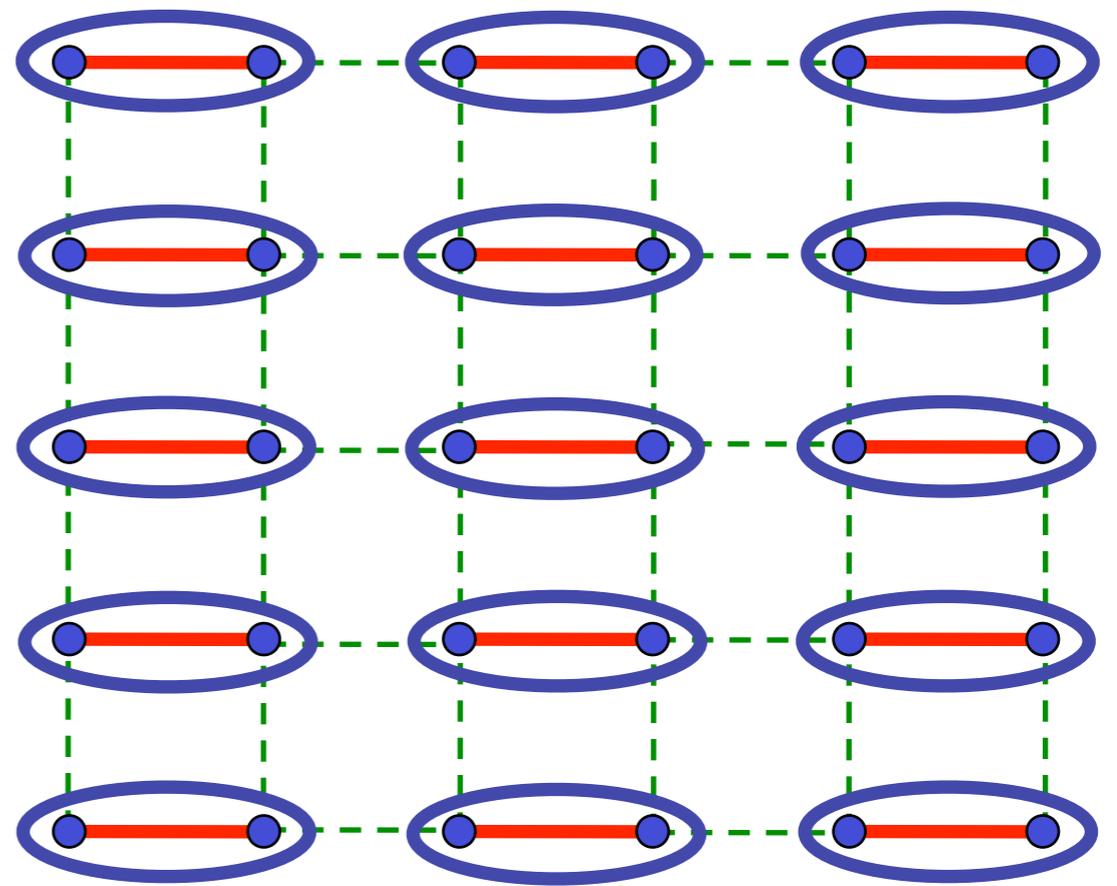

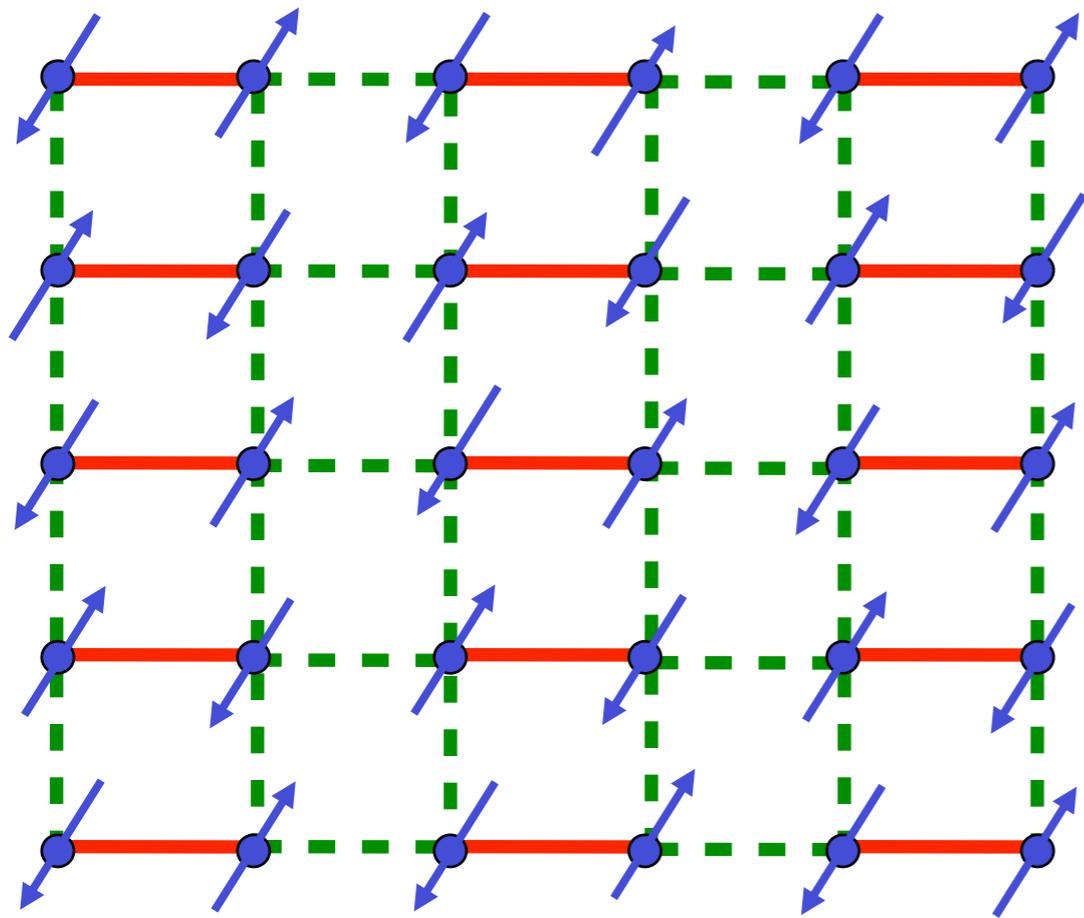

$$H = \sum_{\langle ij \rangle} J_{ij} \vec{S}_i \cdot \vec{S}_j$$

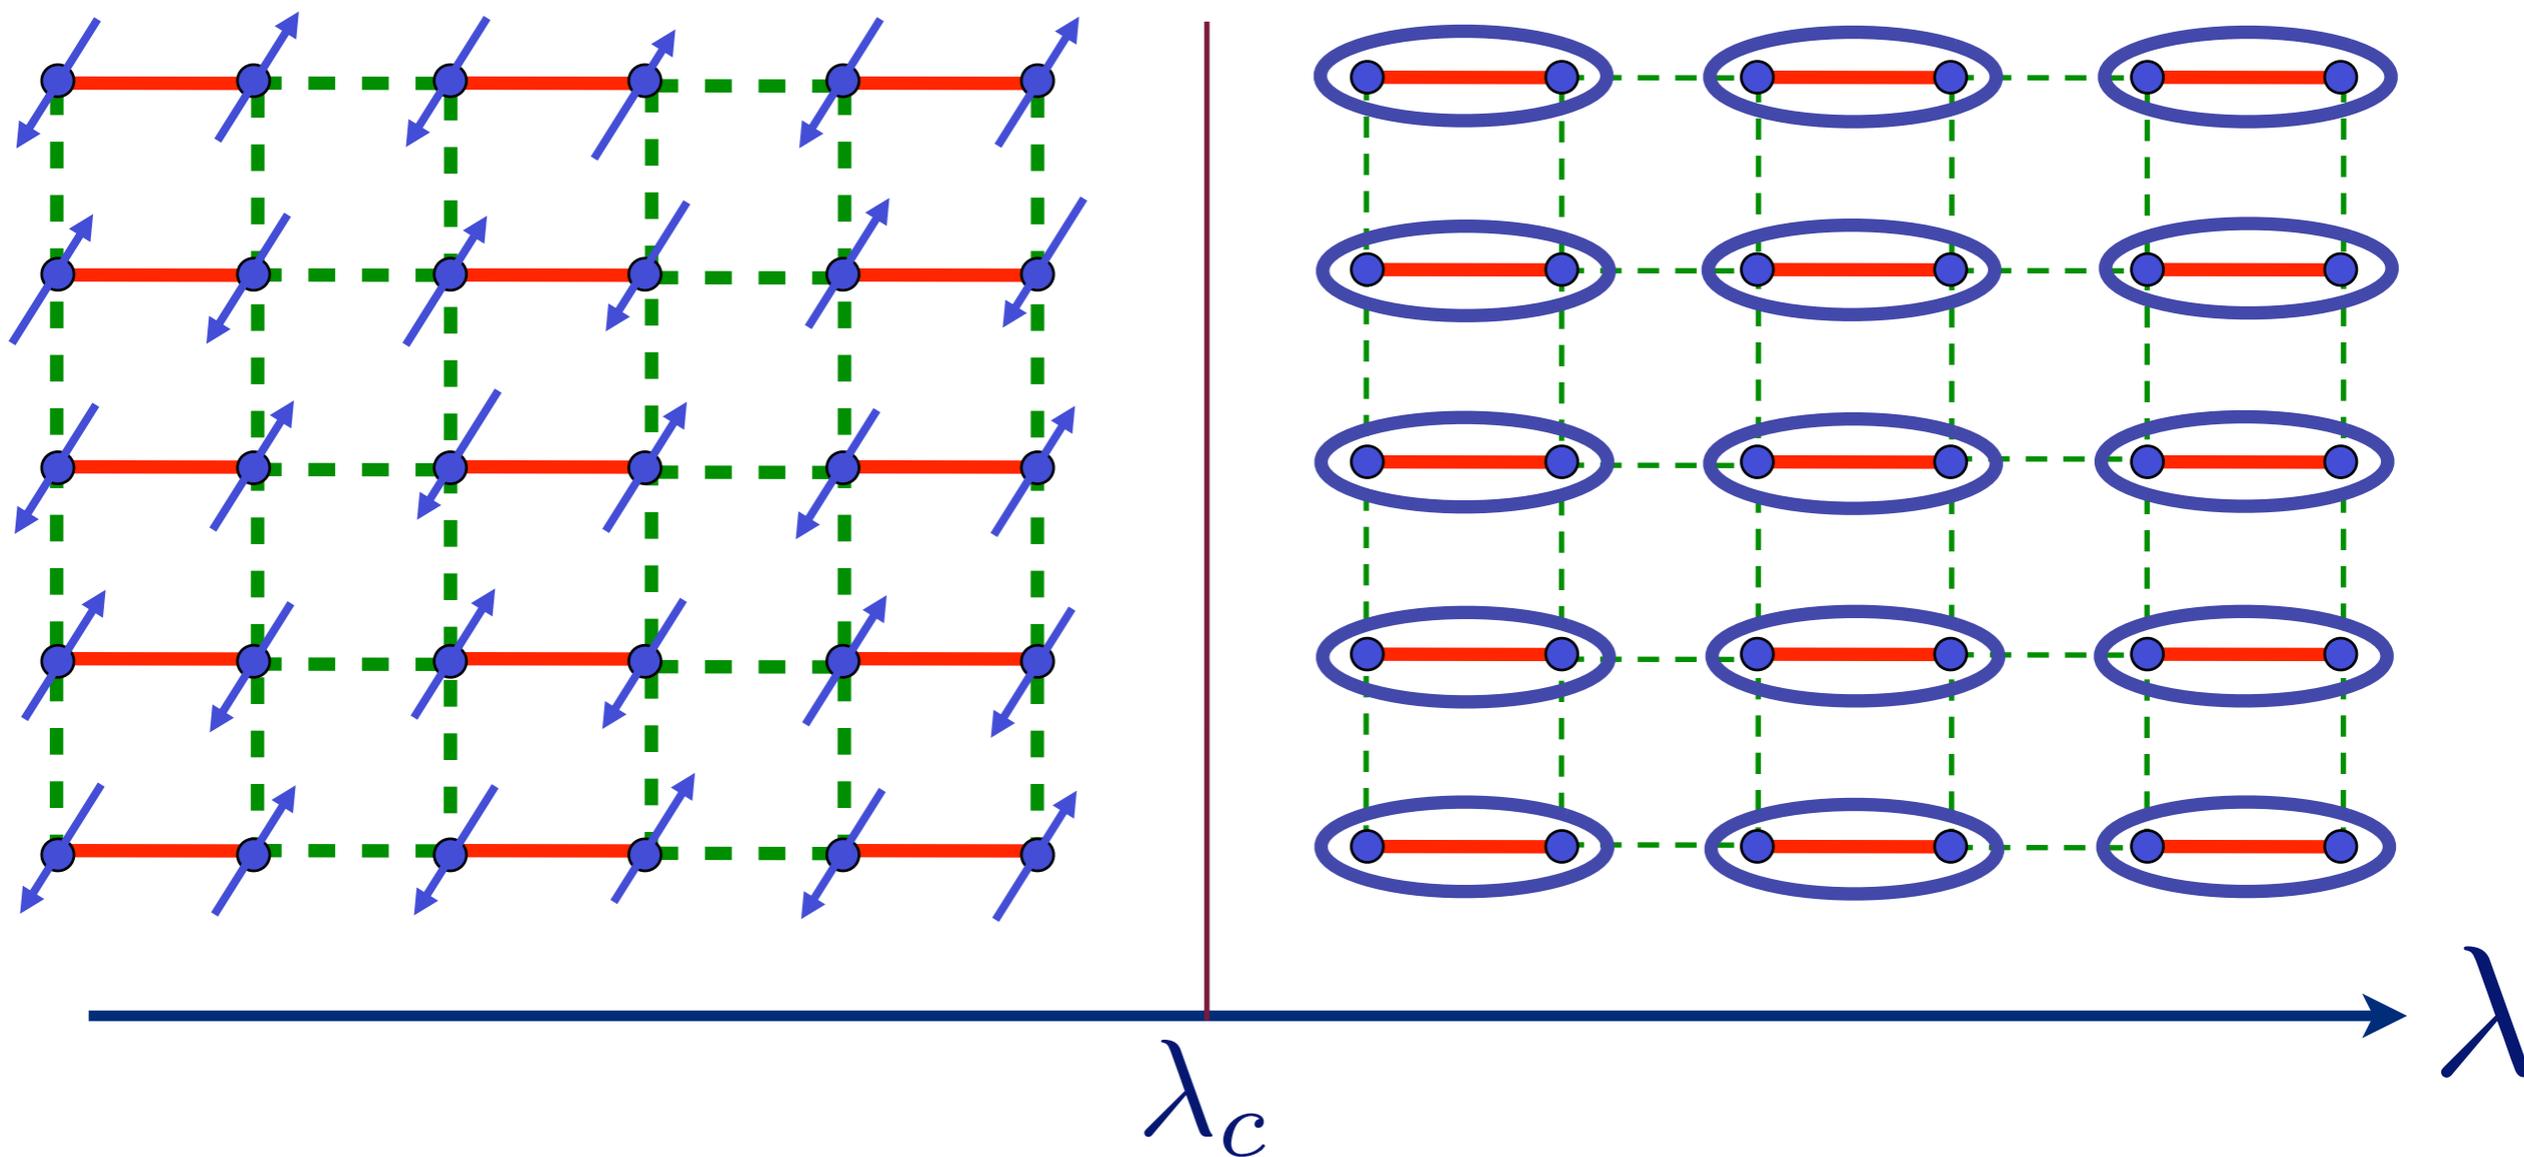

For  $\lambda \approx 1$ , the ground state has antiferromagnetic (“Néel”) order, and the spins align in a checkerboard pattern.

There is a broken  $O(3)$  symmetry characterized by an order parameter  $\vec{\varphi} \sim (-1)^{i_x+i_y} \vec{S}_i$

$$\text{Diagram of two blue dots connected by a red line, enclosed in a blue oval} = \frac{1}{\sqrt{2}} \left( |\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle \right)$$

$$\text{Diagram of two blue spheres connected by a red line, enclosed in a blue oval} = \frac{1}{\sqrt{2}} \left( |\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle \right)$$

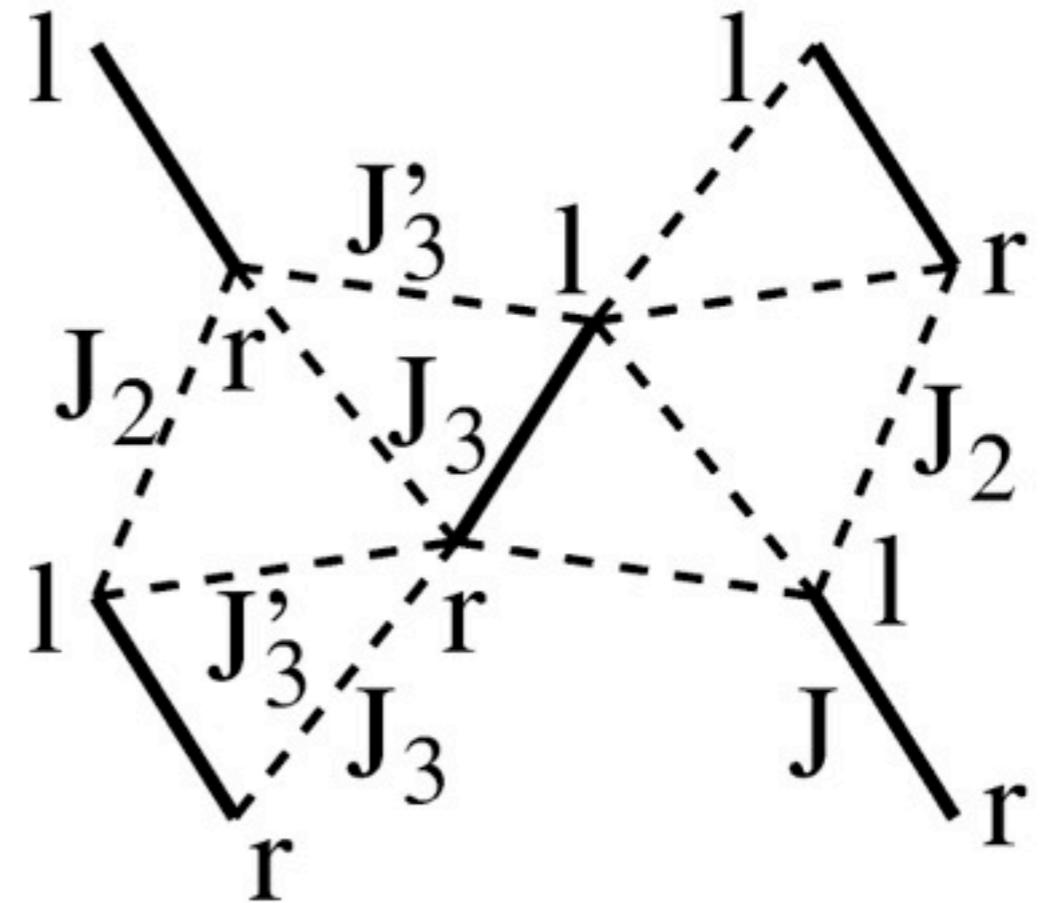

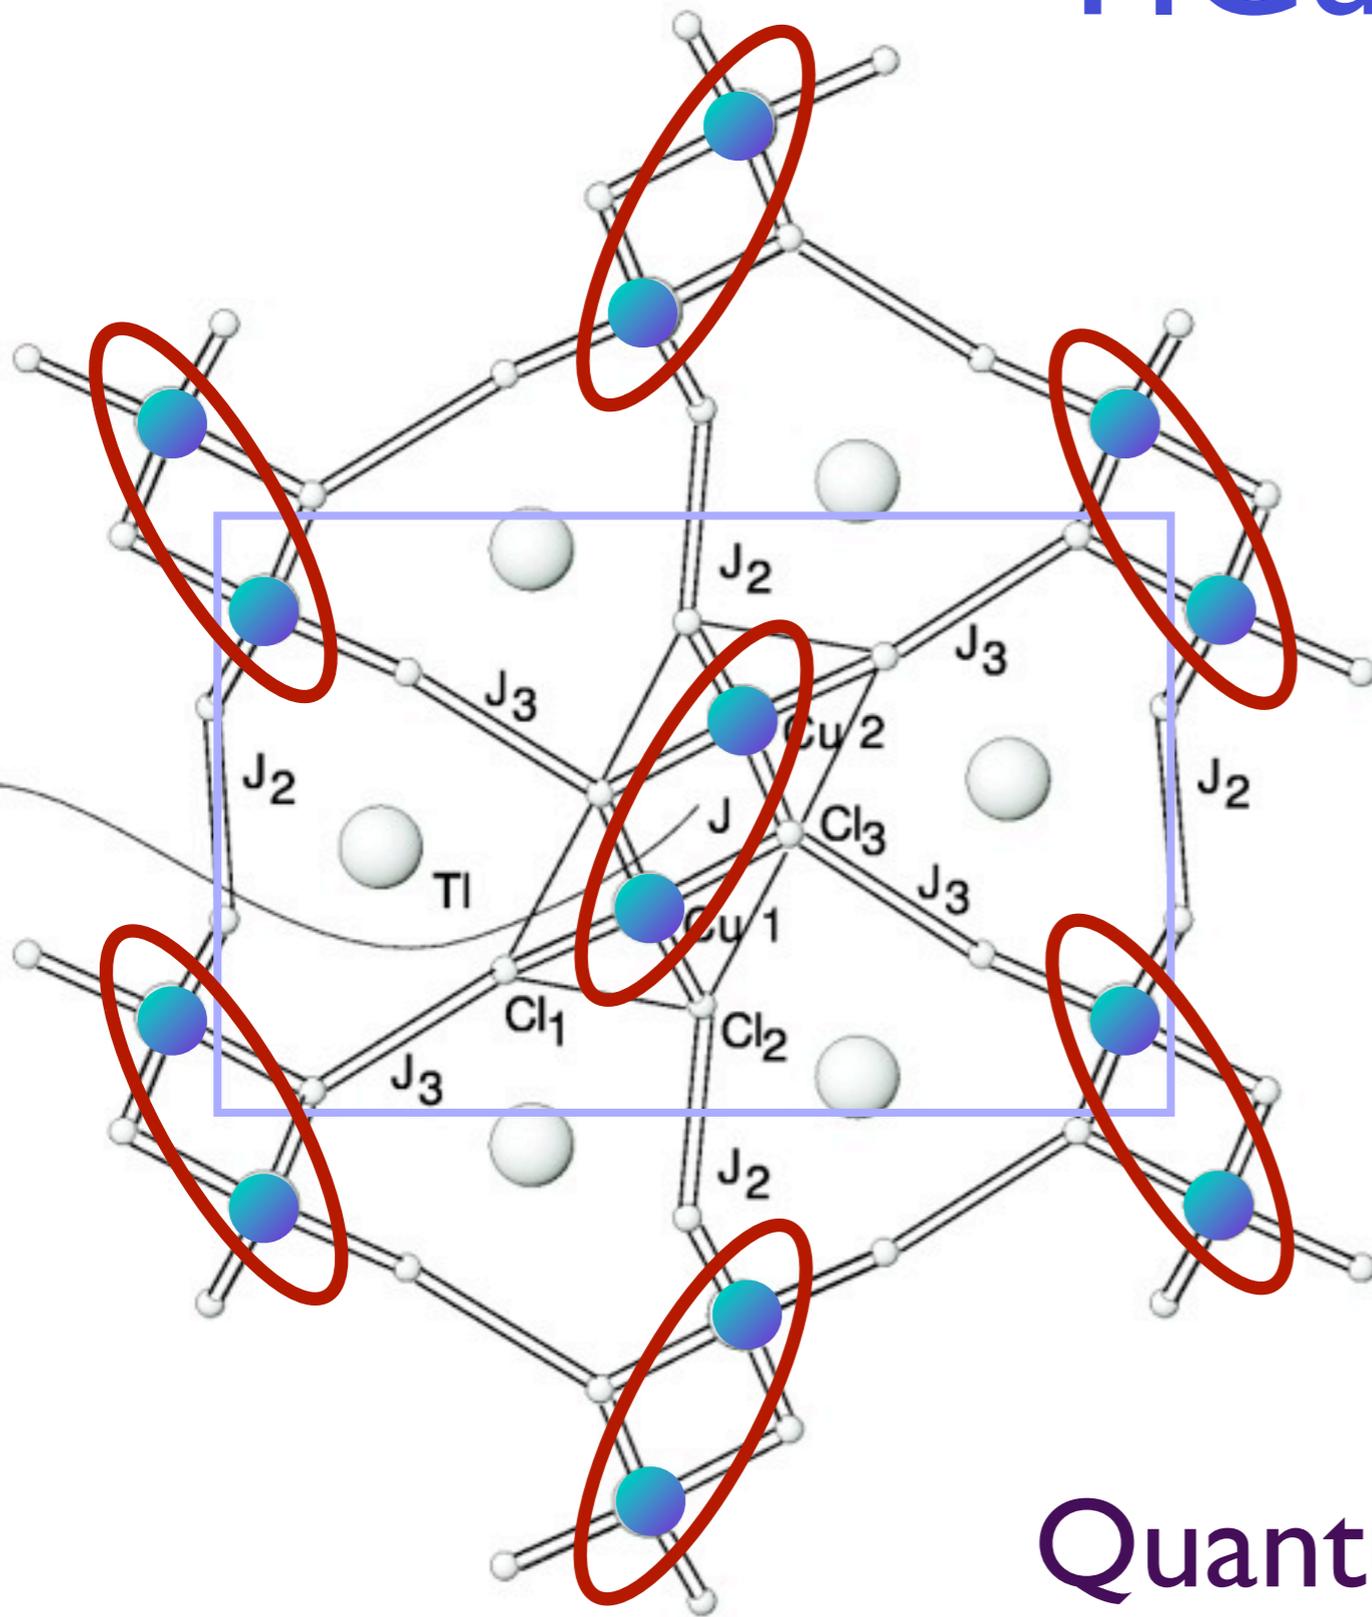

Pressure in  $\text{TlCuCl}_3$

A. Oosawa, K. Kakurai, T. Osakabe, M. Nakamura, M. Takeda, and H. Tanaka, *Journal of the Physical Society of Japan*, **73**, 1446 (2004).

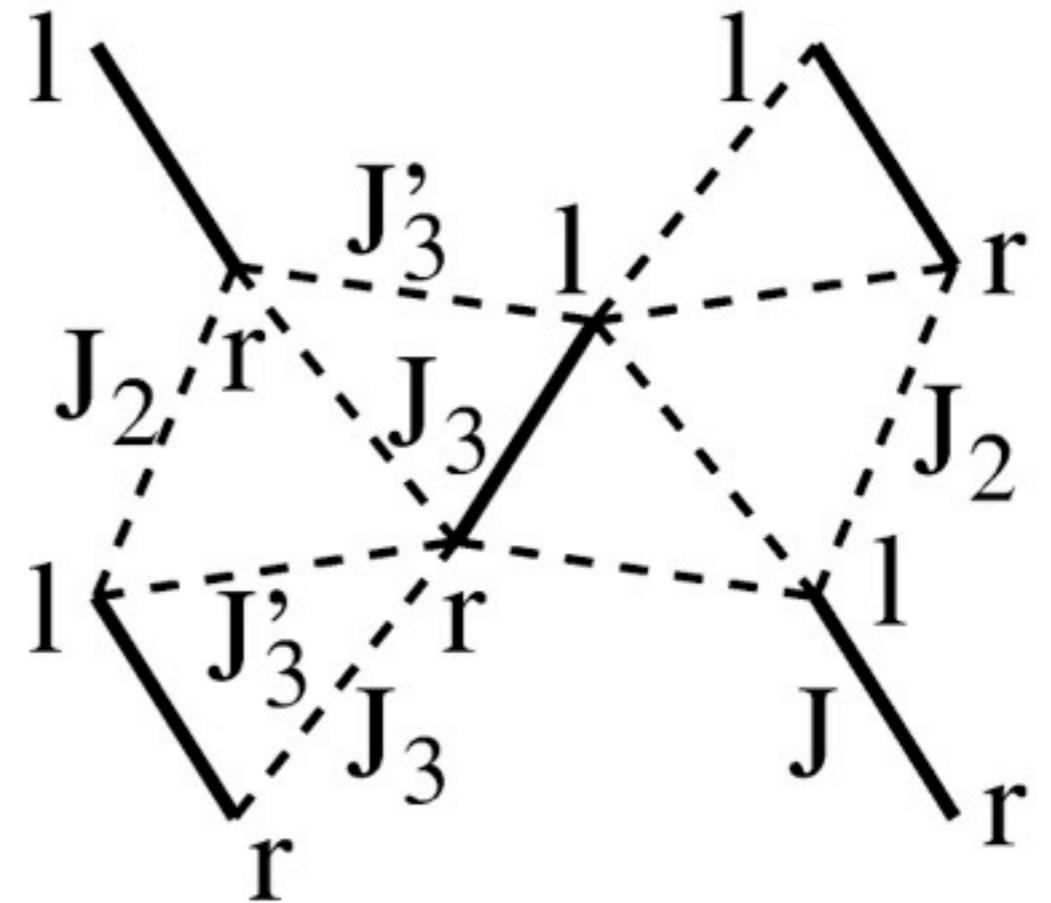

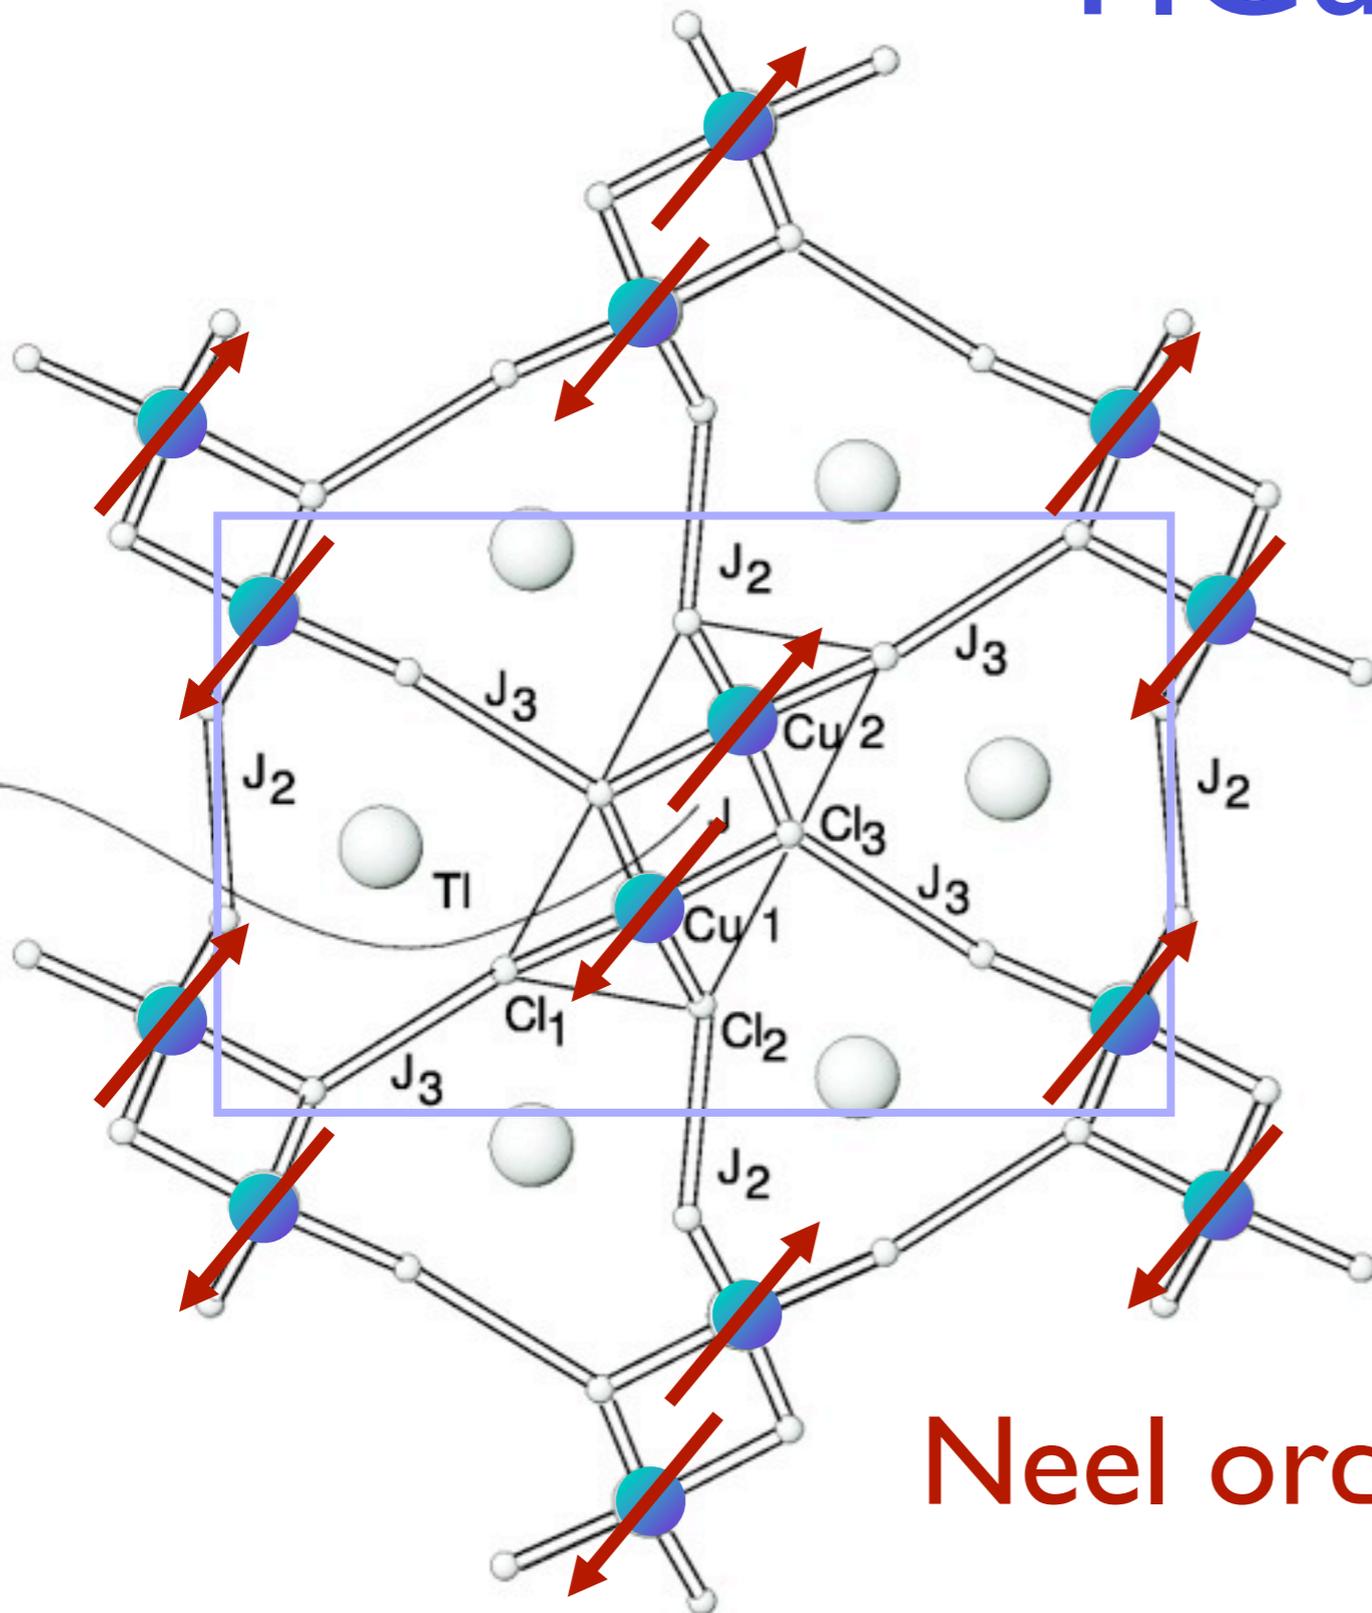

# TlCuCl<sub>3</sub>

Quantum paramagnet at  
ambient pressure

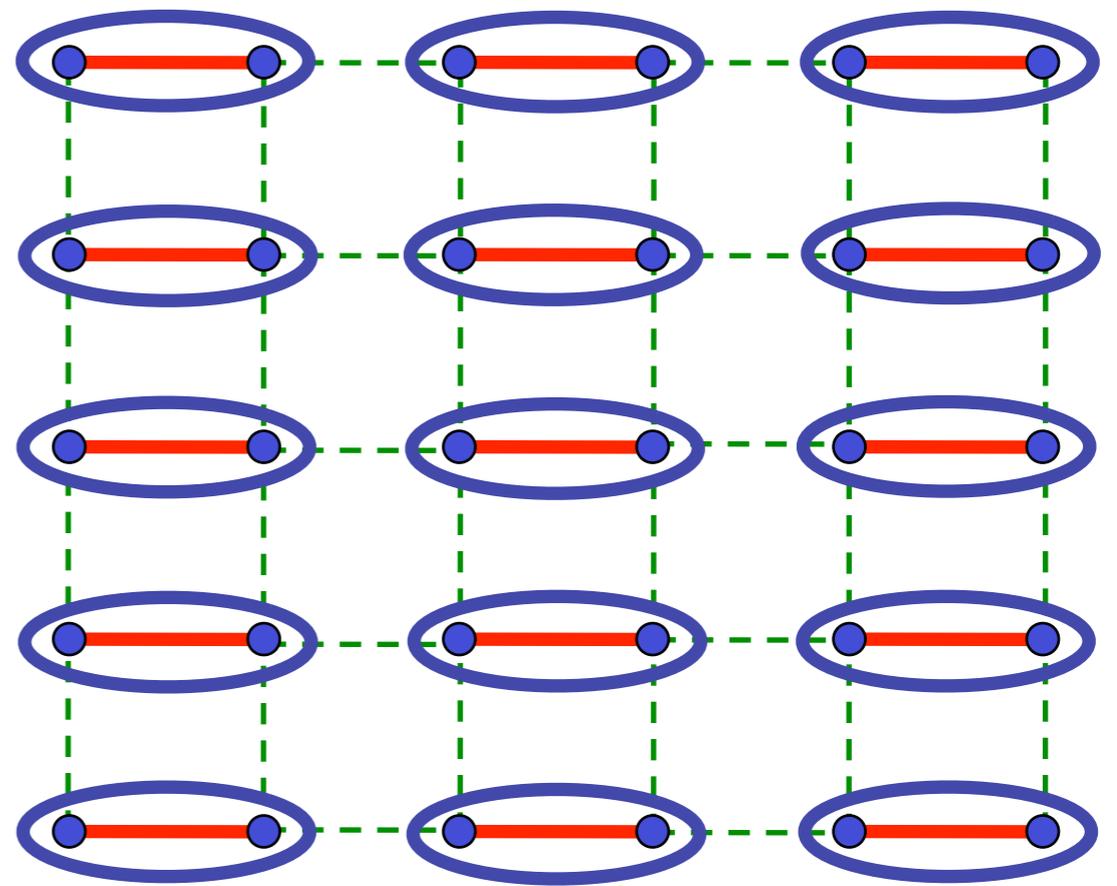

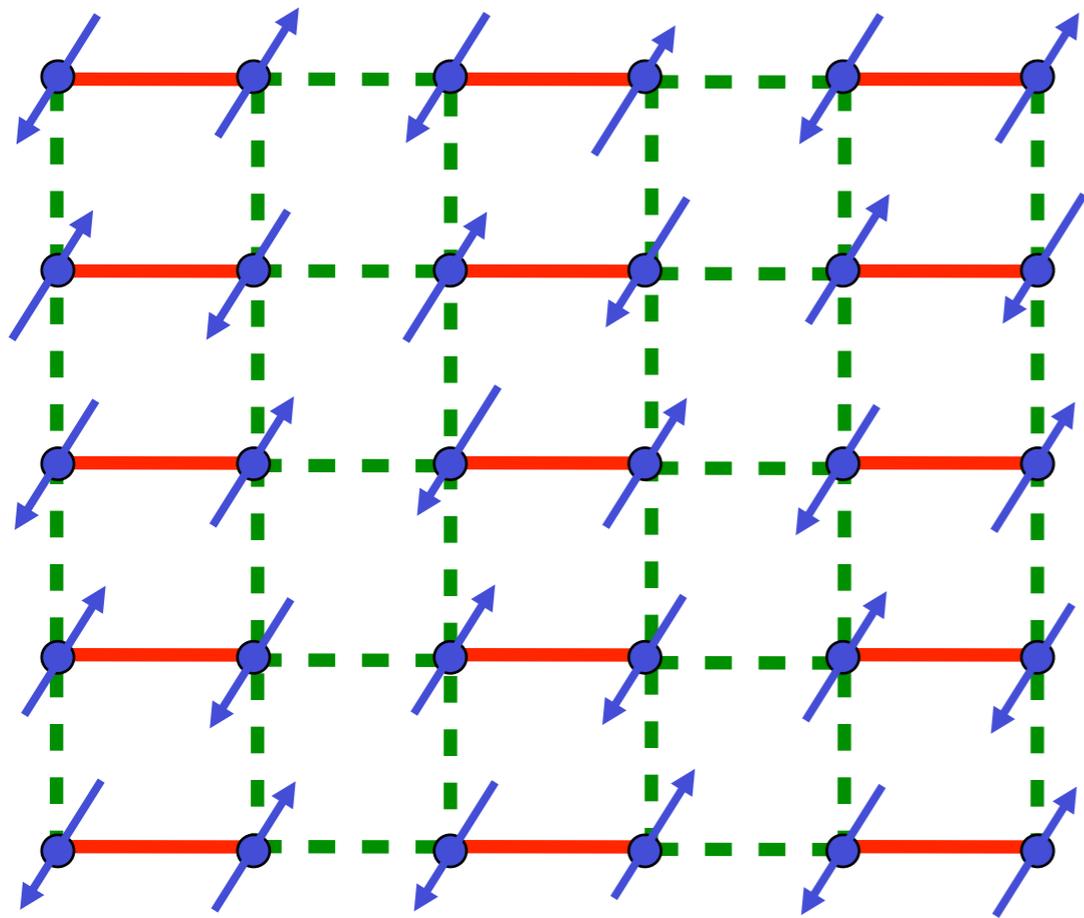

# TlCuCl<sub>3</sub>

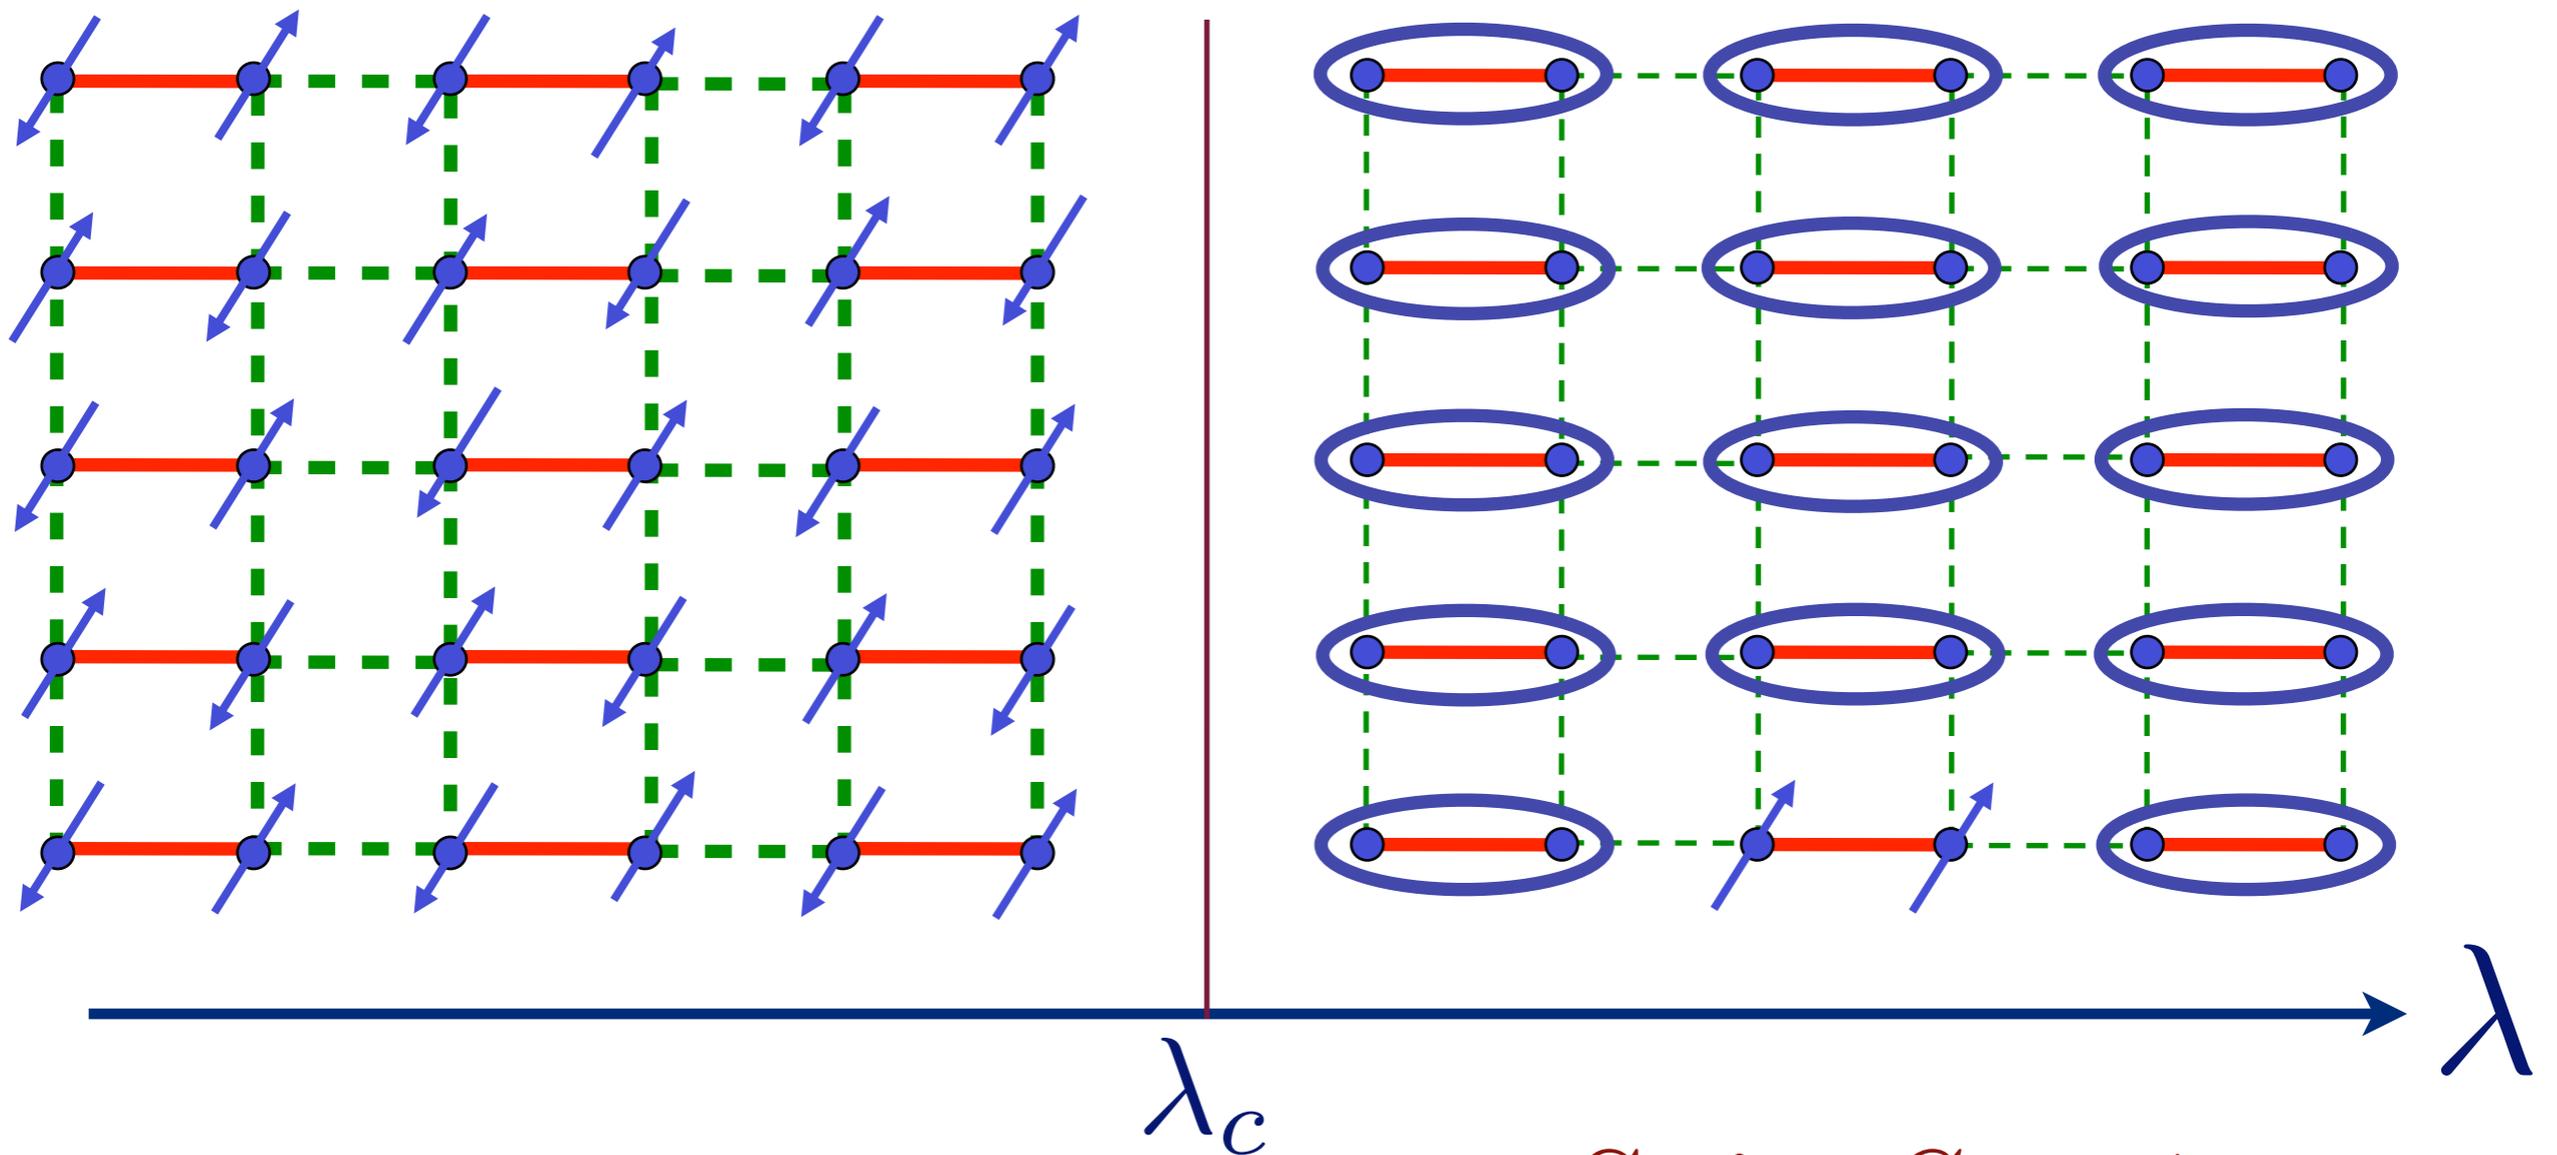

Neel order under pressure

A. Oosawa, K. Kakurai, T. Osakabe, M. Nakamura, M. Takeda, and H. Tanaka, *Journal of the Physical Society of Japan*, **73**, 1446 (2004).

$$\text{Diagram of two blue dots connected by a red line, enclosed in a blue oval} = \frac{1}{\sqrt{2}} \left( |\uparrow\downarrow\rangle - |\downarrow\uparrow\rangle \right)$$

Christian Rüegg, Bruce Normand, Masahige Matsumoto, Albert Furrer, Desmond McMorrow, Karl Kramer, Hans-Ulrich Gudel, Severian Gvasaliya, Hannu Mutka, and Martin Boehm, *Phys. Rev. Lett.* **100**, 205701 (2008)

# Prediction of quantum field theory

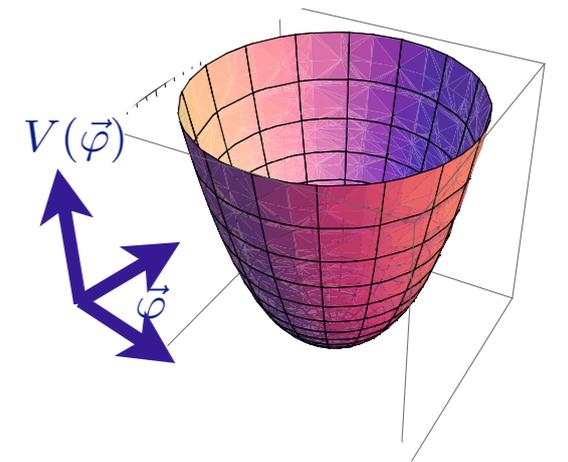

Potential for  $\vec{\varphi}$  fluctuations:  $V(\vec{\varphi}) = (\lambda - \lambda_c)\vec{\varphi}^2 + u(\vec{\varphi}^2)^2$

Paramagnetic phase,  $\lambda > \lambda_c$

Expand about  $\vec{\varphi} = 0$ :

$$V(\vec{\varphi}) \approx (\lambda - \lambda_c)\vec{\varphi}^2$$

Yields 3 particles with energy gap  $\sim \sqrt{(\lambda - \lambda_c)}$

# Prediction of quantum field theory

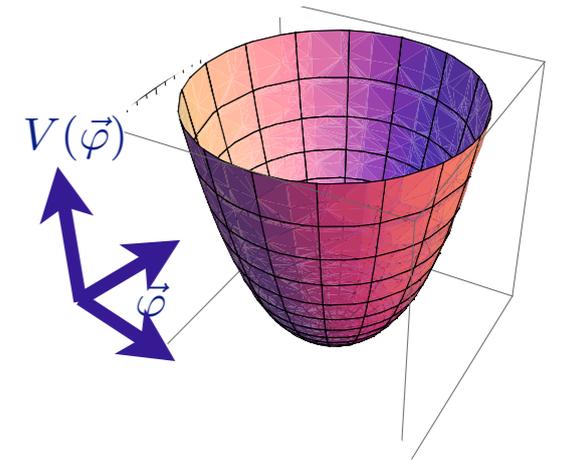

Potential for  $\vec{\varphi}$  fluctuations:  $V(\vec{\varphi}) = (\lambda - \lambda_c)\vec{\varphi}^2 + u(\vec{\varphi}^2)^2$

Paramagnetic phase,  $\lambda > \lambda_c$

Expand about  $\vec{\varphi} = 0$ :

$$V(\vec{\varphi}) \approx (\lambda - \lambda_c)\vec{\varphi}^2$$

Yields 3 particles with energy gap  $\sim \sqrt{(\lambda - \lambda_c)}$

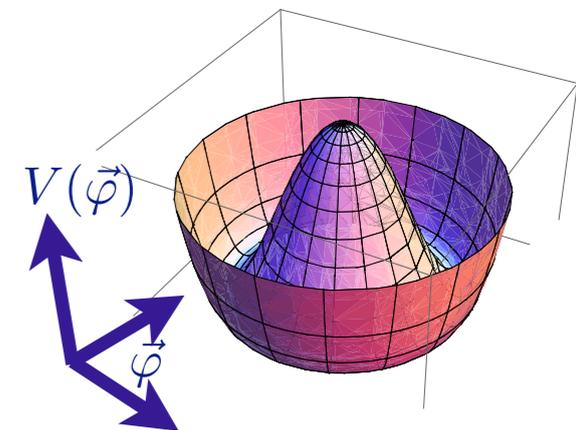

Néel phase,  $\lambda < \lambda_c$

Expand  $\vec{\varphi} = (0, 0, \sqrt{(\lambda_c - \lambda)/(2u)}) + \vec{\varphi}_1$ :

$$V(\vec{\varphi}) \approx 2(\lambda_c - \lambda)\varphi_{1z}^2$$

Yields 2 gapless spin waves and one Higgs particle with energy gap  $\sim \sqrt{2(\lambda_c - \lambda)}$

# Prediction of quantum field theory

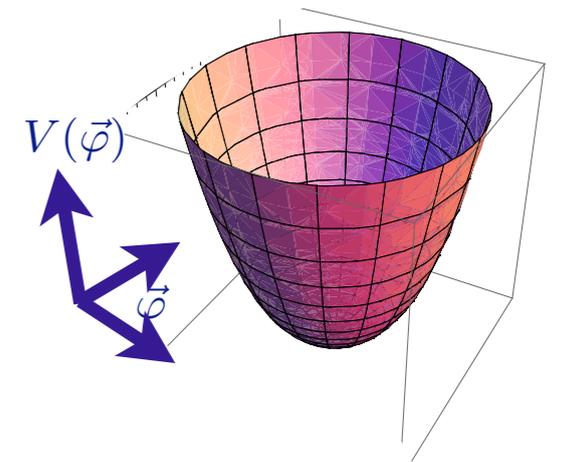

Potential for  $\vec{\varphi}$  fluctuations:  $V(\vec{\varphi}) = (\lambda - \lambda_c)\vec{\varphi}^2 + u(\vec{\varphi}^2)^2$

Paramagnetic phase,  $\lambda > \lambda_c$

Expand about  $\vec{\varphi} = 0$ :

$$V(\vec{\varphi}) \approx (\lambda - \lambda_c)\vec{\varphi}^2$$

Yields 3 particles with energy gap  $\sim \sqrt{(\lambda - \lambda_c)}$

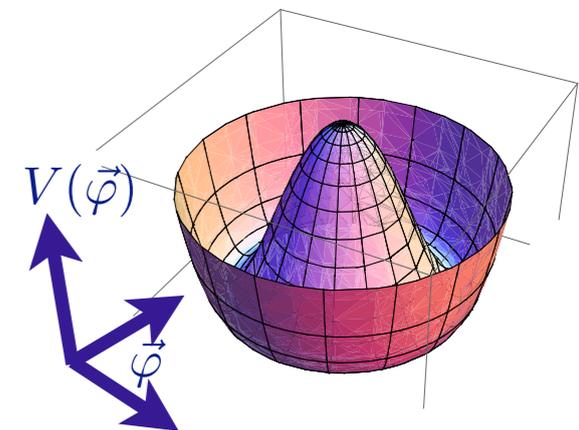

Néel phase,  $\lambda < \lambda_c$

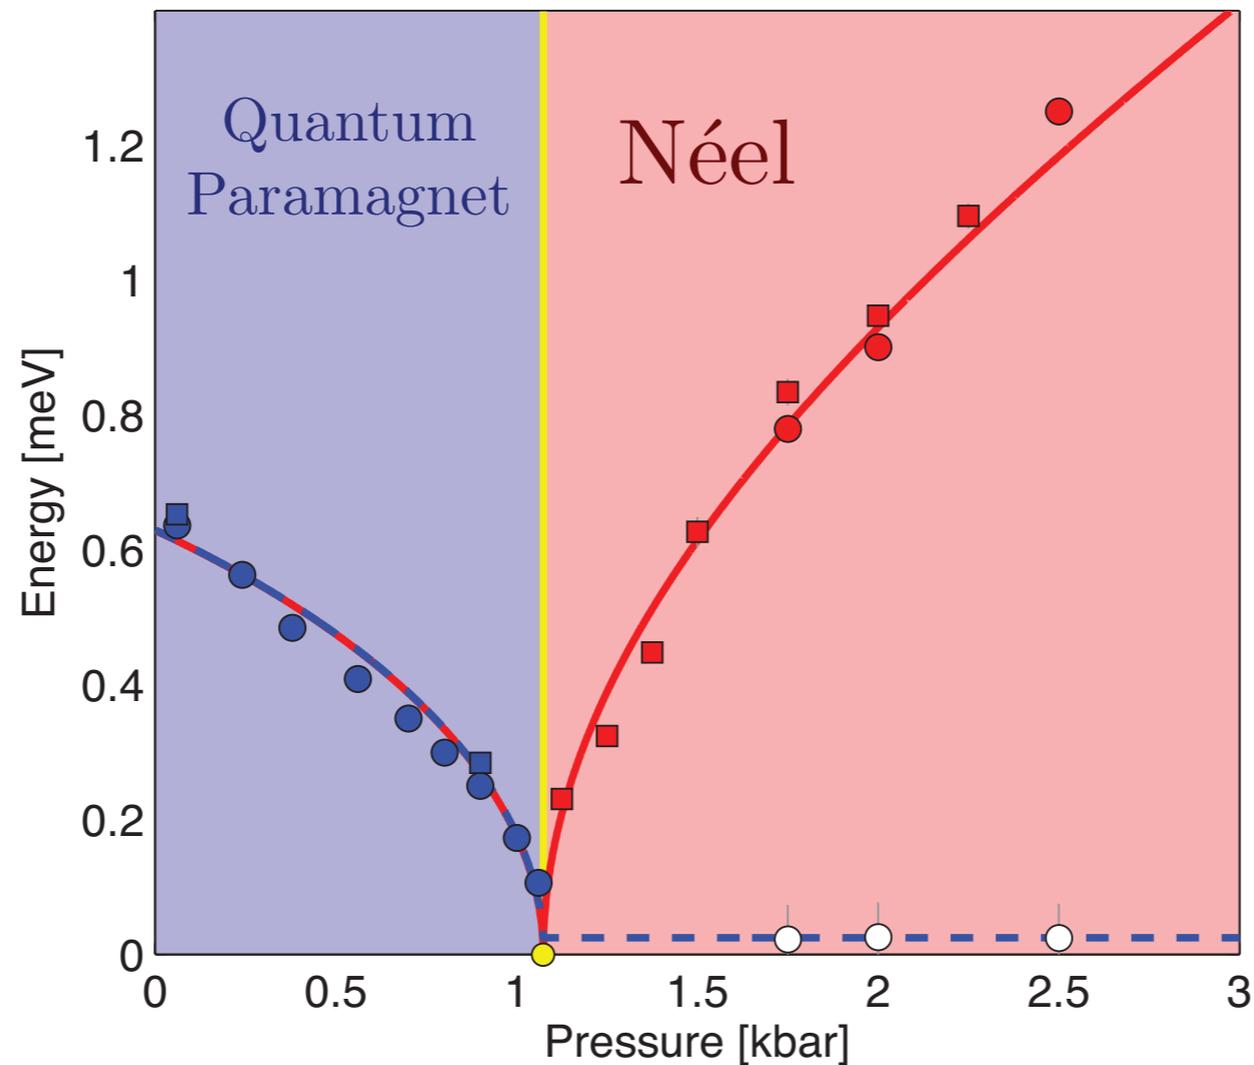

Expand  $\vec{\varphi} = (0, 0, \sqrt{(\lambda_c - \lambda)/(2u)}) + \vec{\varphi}_1$ :

$$V(\vec{\varphi}) \approx 2(\lambda_c - \lambda)\varphi_{1z}^2$$

Yields 2 gapless spin waves and one Higgs particle with energy gap  $\sim \sqrt{2(\lambda_c - \lambda)}$

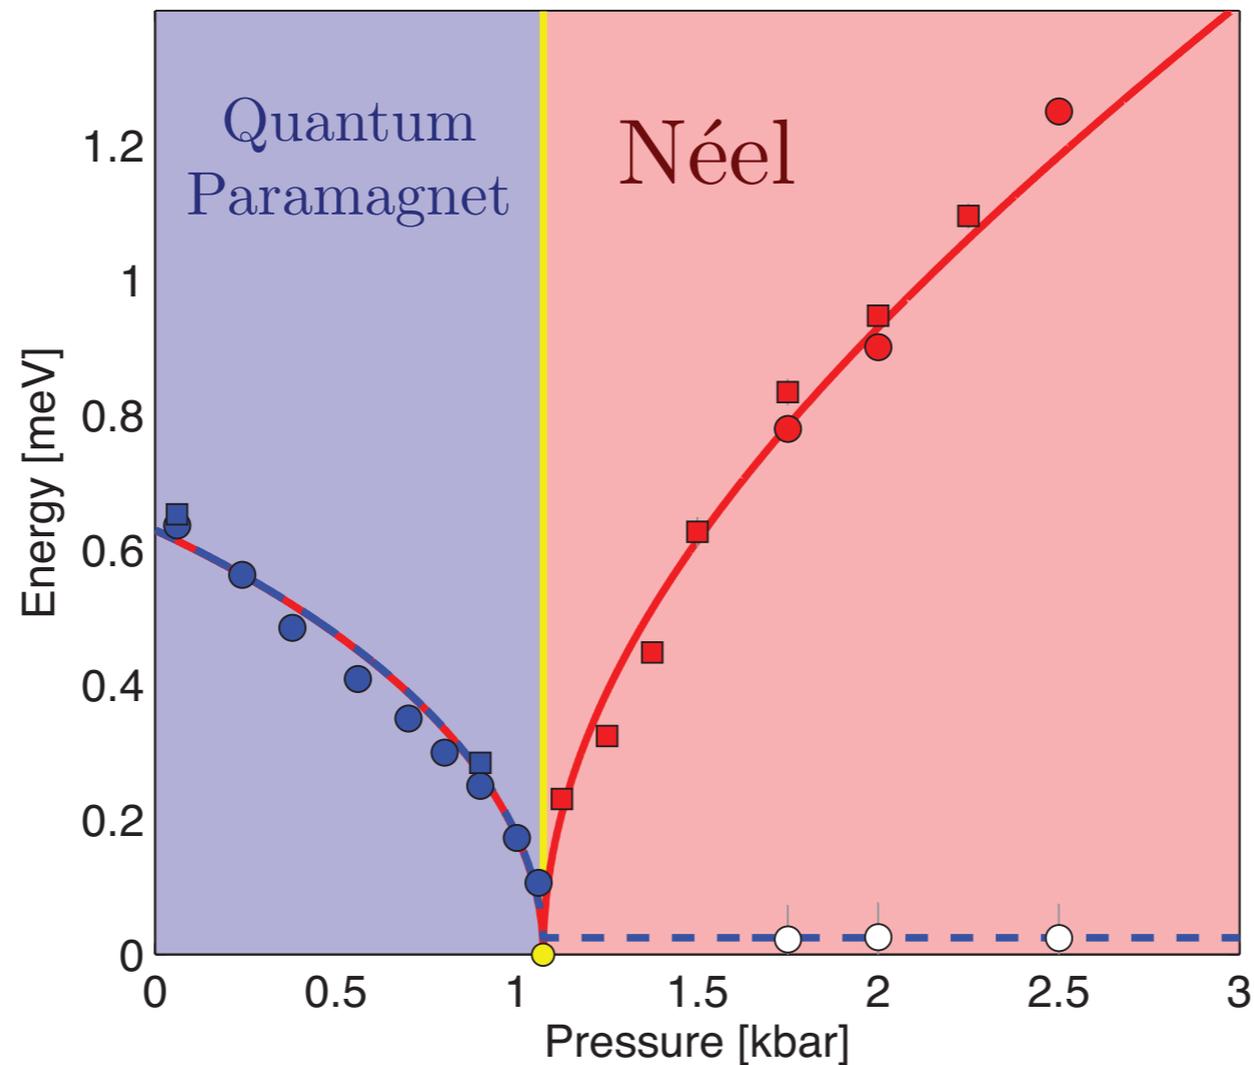

# Excitations of $\text{TlCuCl}_3$ with varying pressure

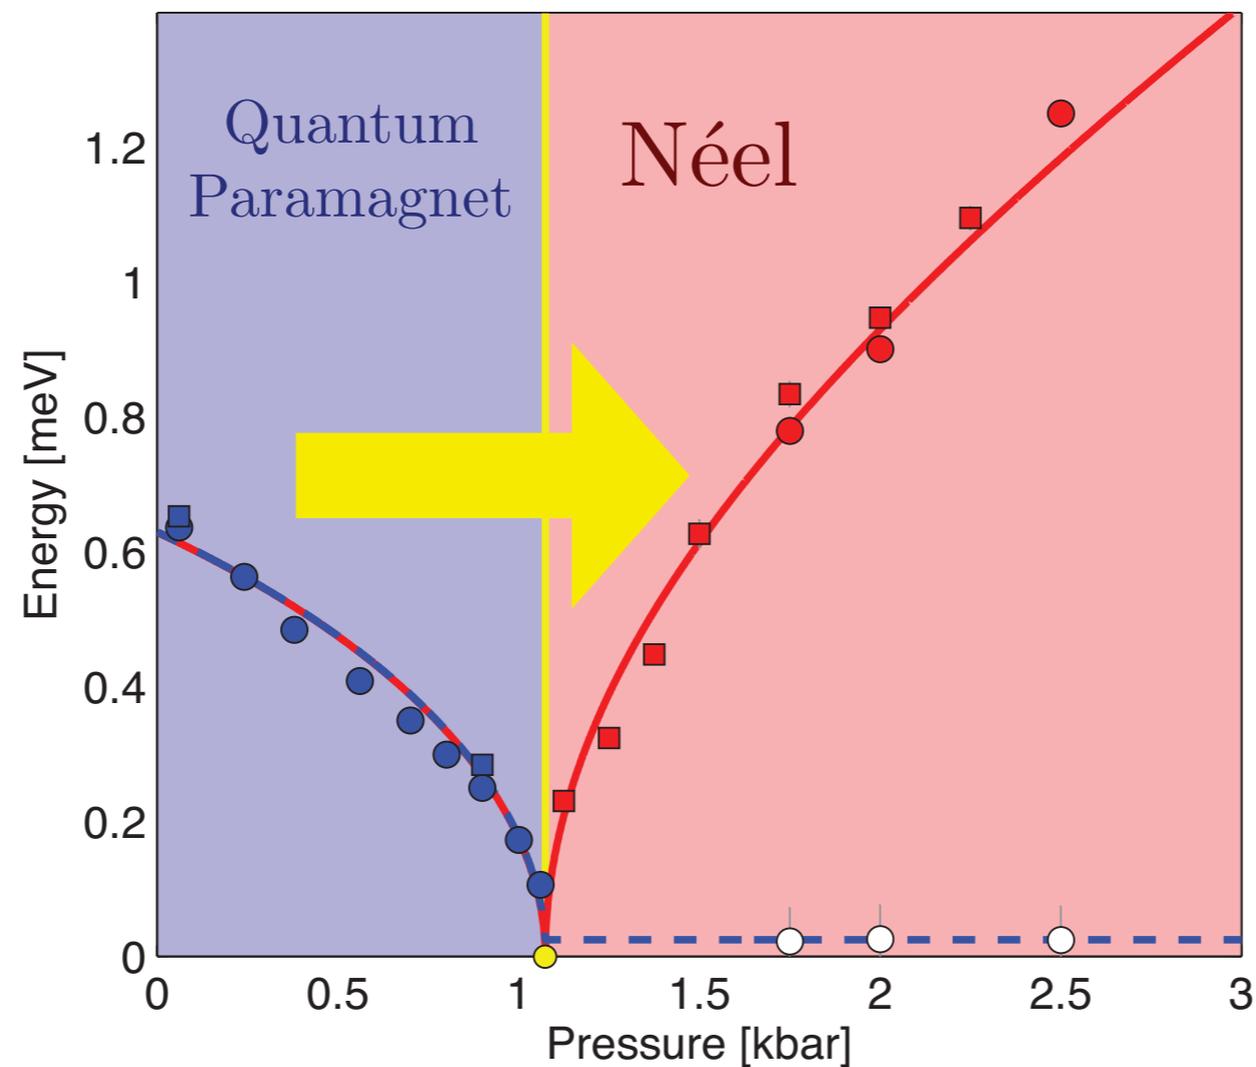

Christian Ruedg, Bruce Normand, Masashige Matsumoto, Albert Furrer, Desmond McMorro, Karl Kramer, Hans-Ulrich Gudel, Severian Gvasaliya, Hannu Mutka, and Martin Boehm, *Phys. Rev. Lett.* **100**, 205701 (2008)

A conformal field theory in 2+1  
spacetime dimensions: CFT3

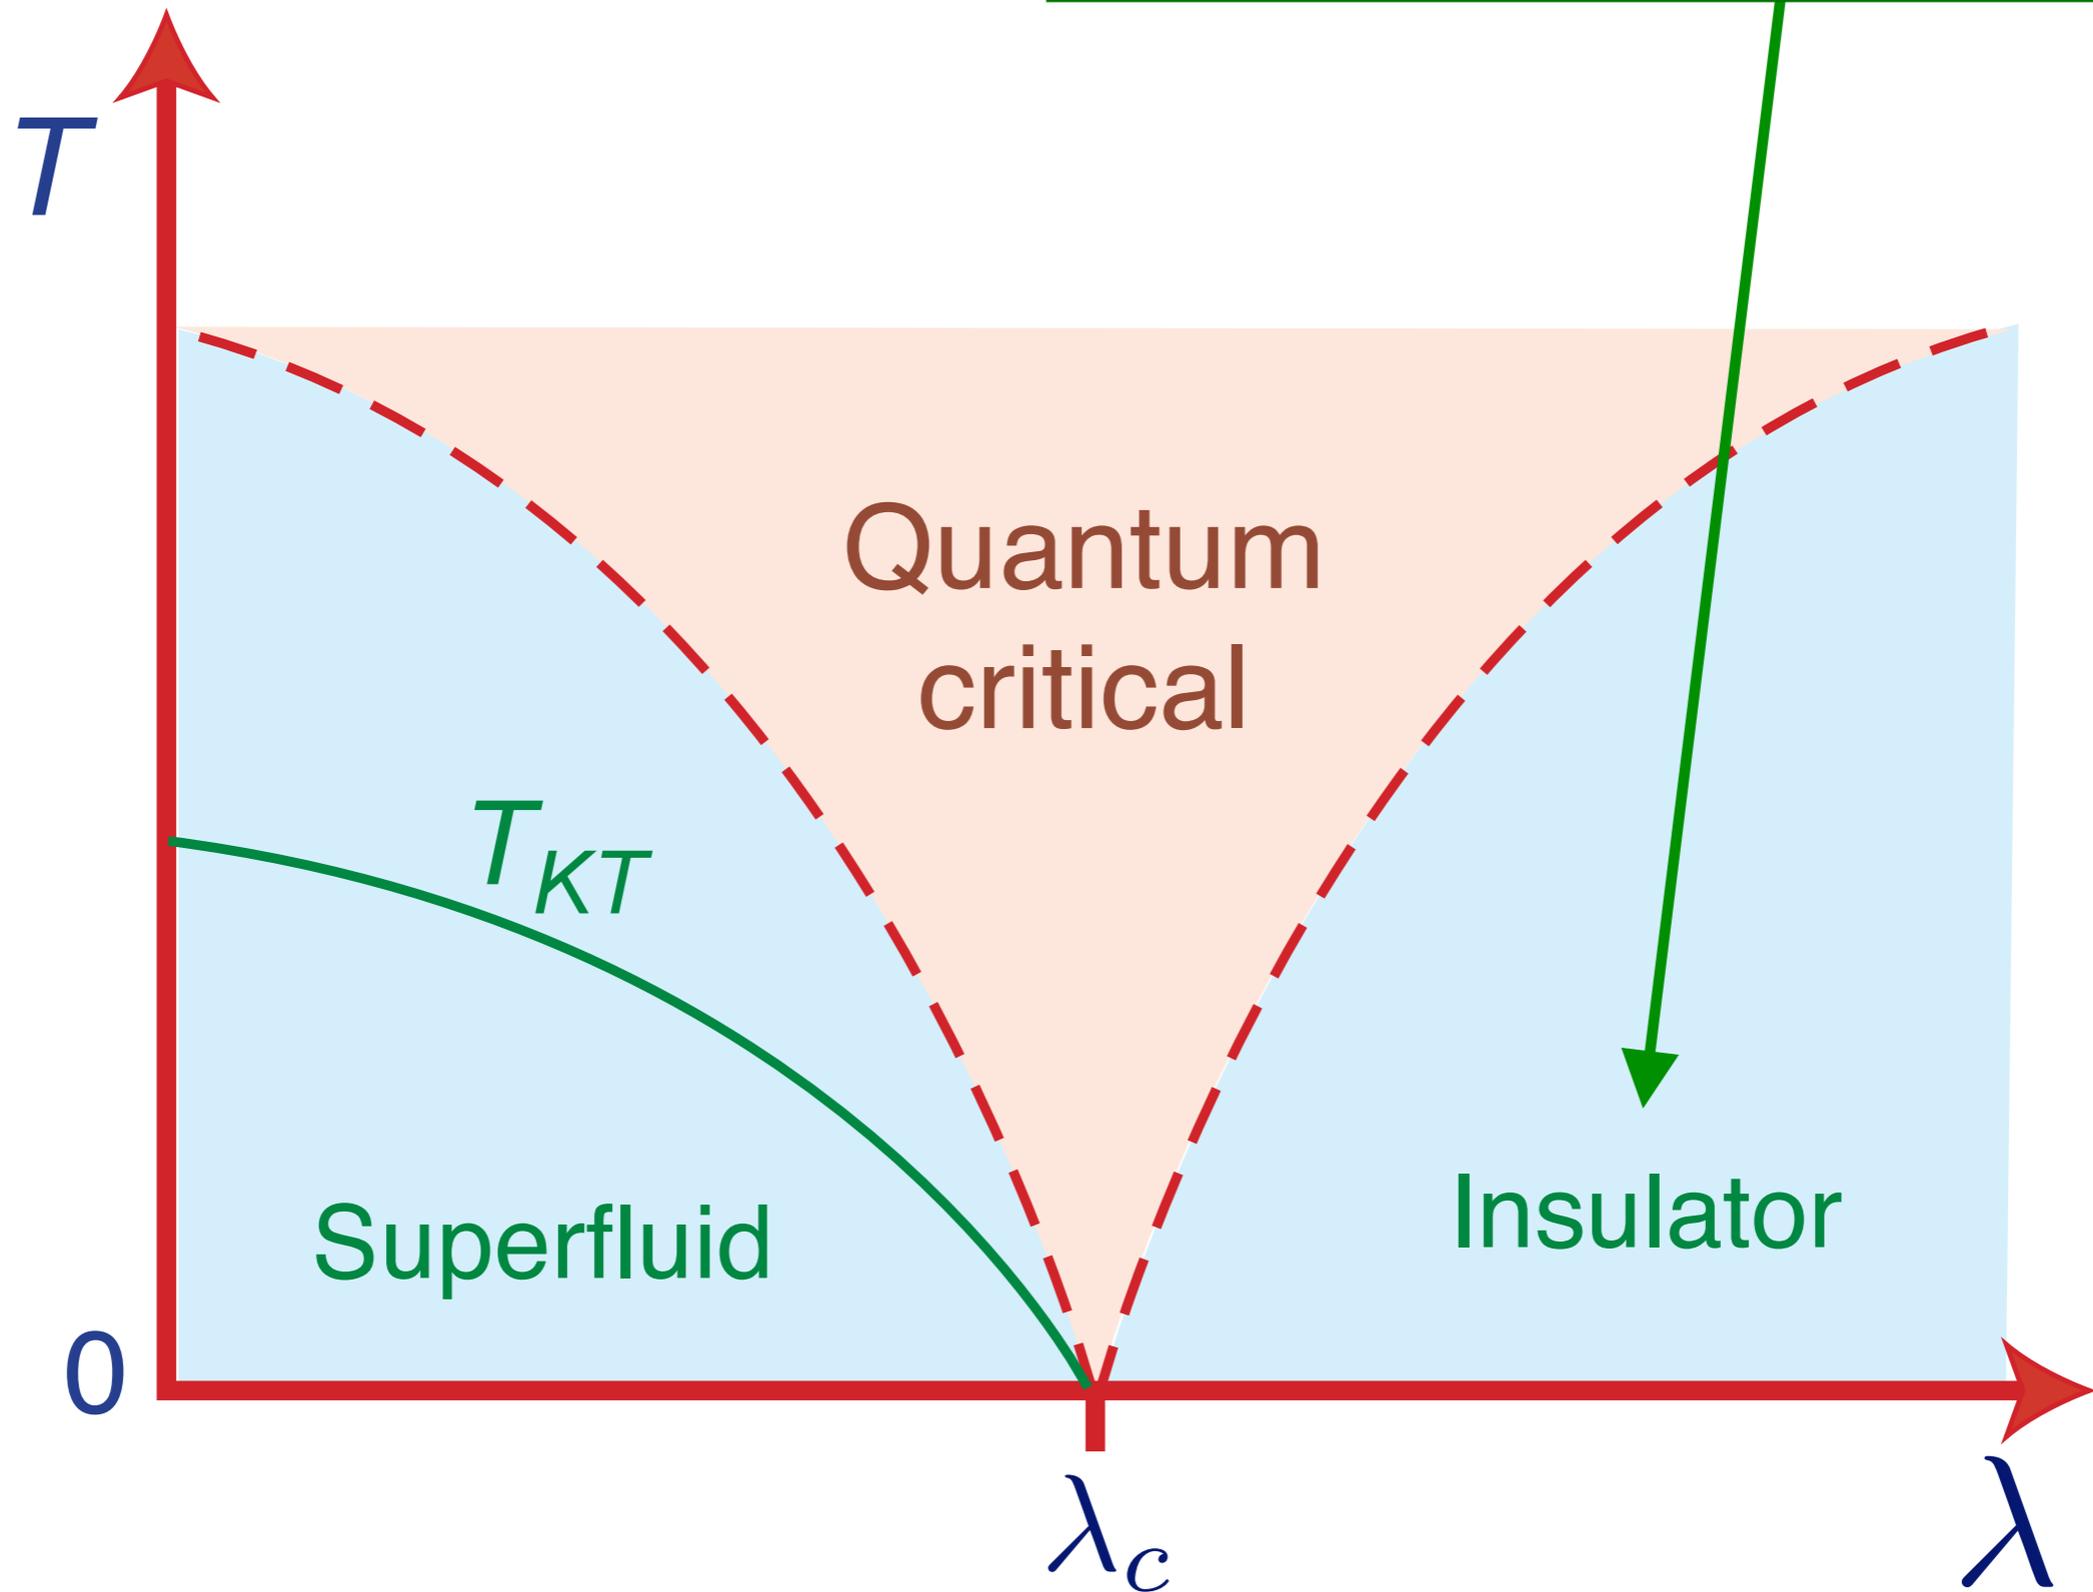

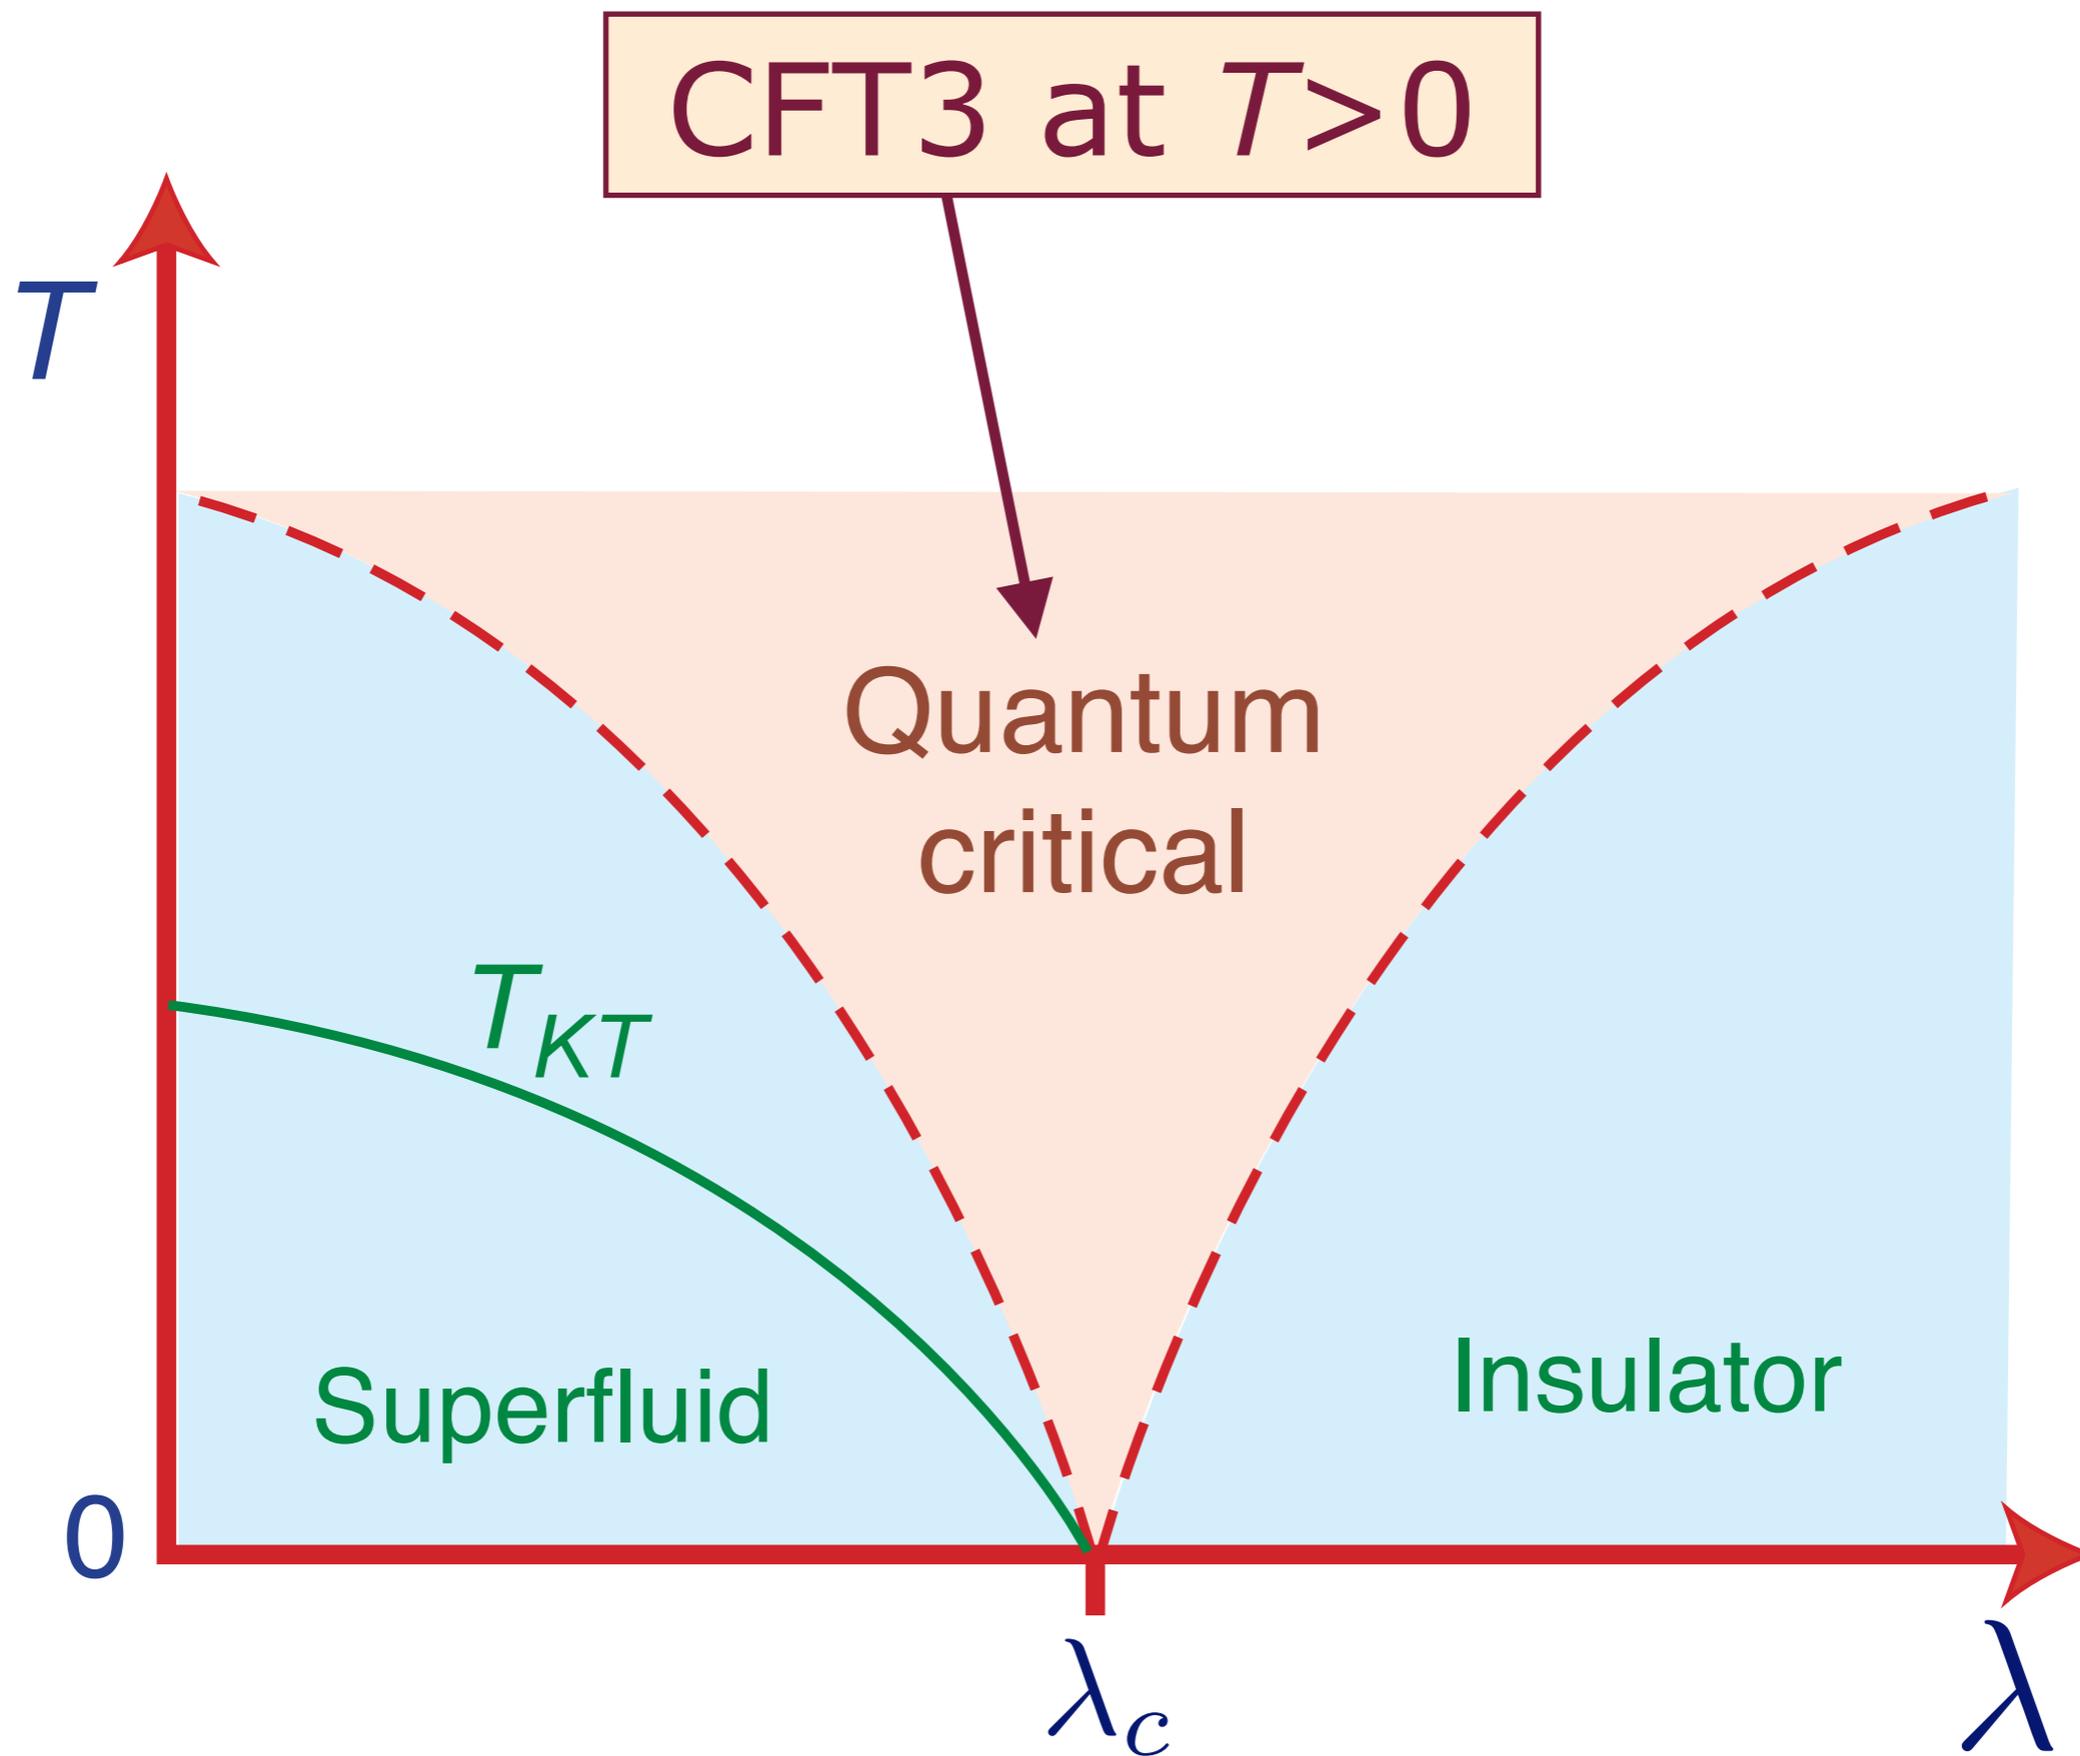

# Classical vortices and Goldstone oscillations

Classical Boltzmann gas  
of particles and holes

# Quantum critical dynamics

Quantum “*nearly perfect fluid*”  
with shortest possible local equilibration time,  $\tau_{\text{eq}}$

$$\tau_{\text{eq}} = \mathcal{C} \frac{\hbar}{k_B T}$$

where  $\mathcal{C}$  is a *universal* constant.

Response functions are characterized by poles in LHP  
with  $\omega \sim k_B T / \hbar$   
(analogous of Higgs pole)

S. Sachdev, *Quantum Phase Transitions*, Cambridge (1999).

# Quantum critical dynamics

Transport co-efficients not determined  
by collision rate, but by  
universal constants of nature

## Conductivity

$$\sigma = \frac{Q^2}{h} \times [\text{Universal constant } \mathcal{O}(1) ]$$

( $Q$  is the “charge” of one boson)

M.P.A. Fisher, G. Grinstein, and S.M. Girvin, *Phys. Rev. Lett.* **64**, 587 (1990)

K. Damle and S. Sachdev, *Phys. Rev. B* **56**, 8714 (1997).

# Quantum critical dynamics

Transport co-efficients not determined  
by collision rate, but by  
universal constants of nature

## Momentum transport

$$\frac{\eta}{s} \equiv \frac{\text{viscosity}}{\text{entropy density}}$$
$$= \frac{\hbar}{k_B} \times [\text{Universal constant } \mathcal{O}(1)]$$

# Quantum critical dynamics

Describe charge transport using Boltzmann theory of interacting bosons:

$$\frac{dv}{dt} + \frac{v}{\tau_c} = F.$$

This gives a frequency ( $\omega$ ) dependent conductivity

$$\sigma(\omega) = \frac{\sigma_0}{1 - i\omega\tau_c}$$

where  $\tau_c \sim \hbar/(k_B T)$  is the time between boson collisions.

# Quantum critical dynamics

Describe charge transport using Boltzmann theory of interacting bosons:

$$\frac{dv}{dt} + \frac{v}{\tau_c} = F.$$

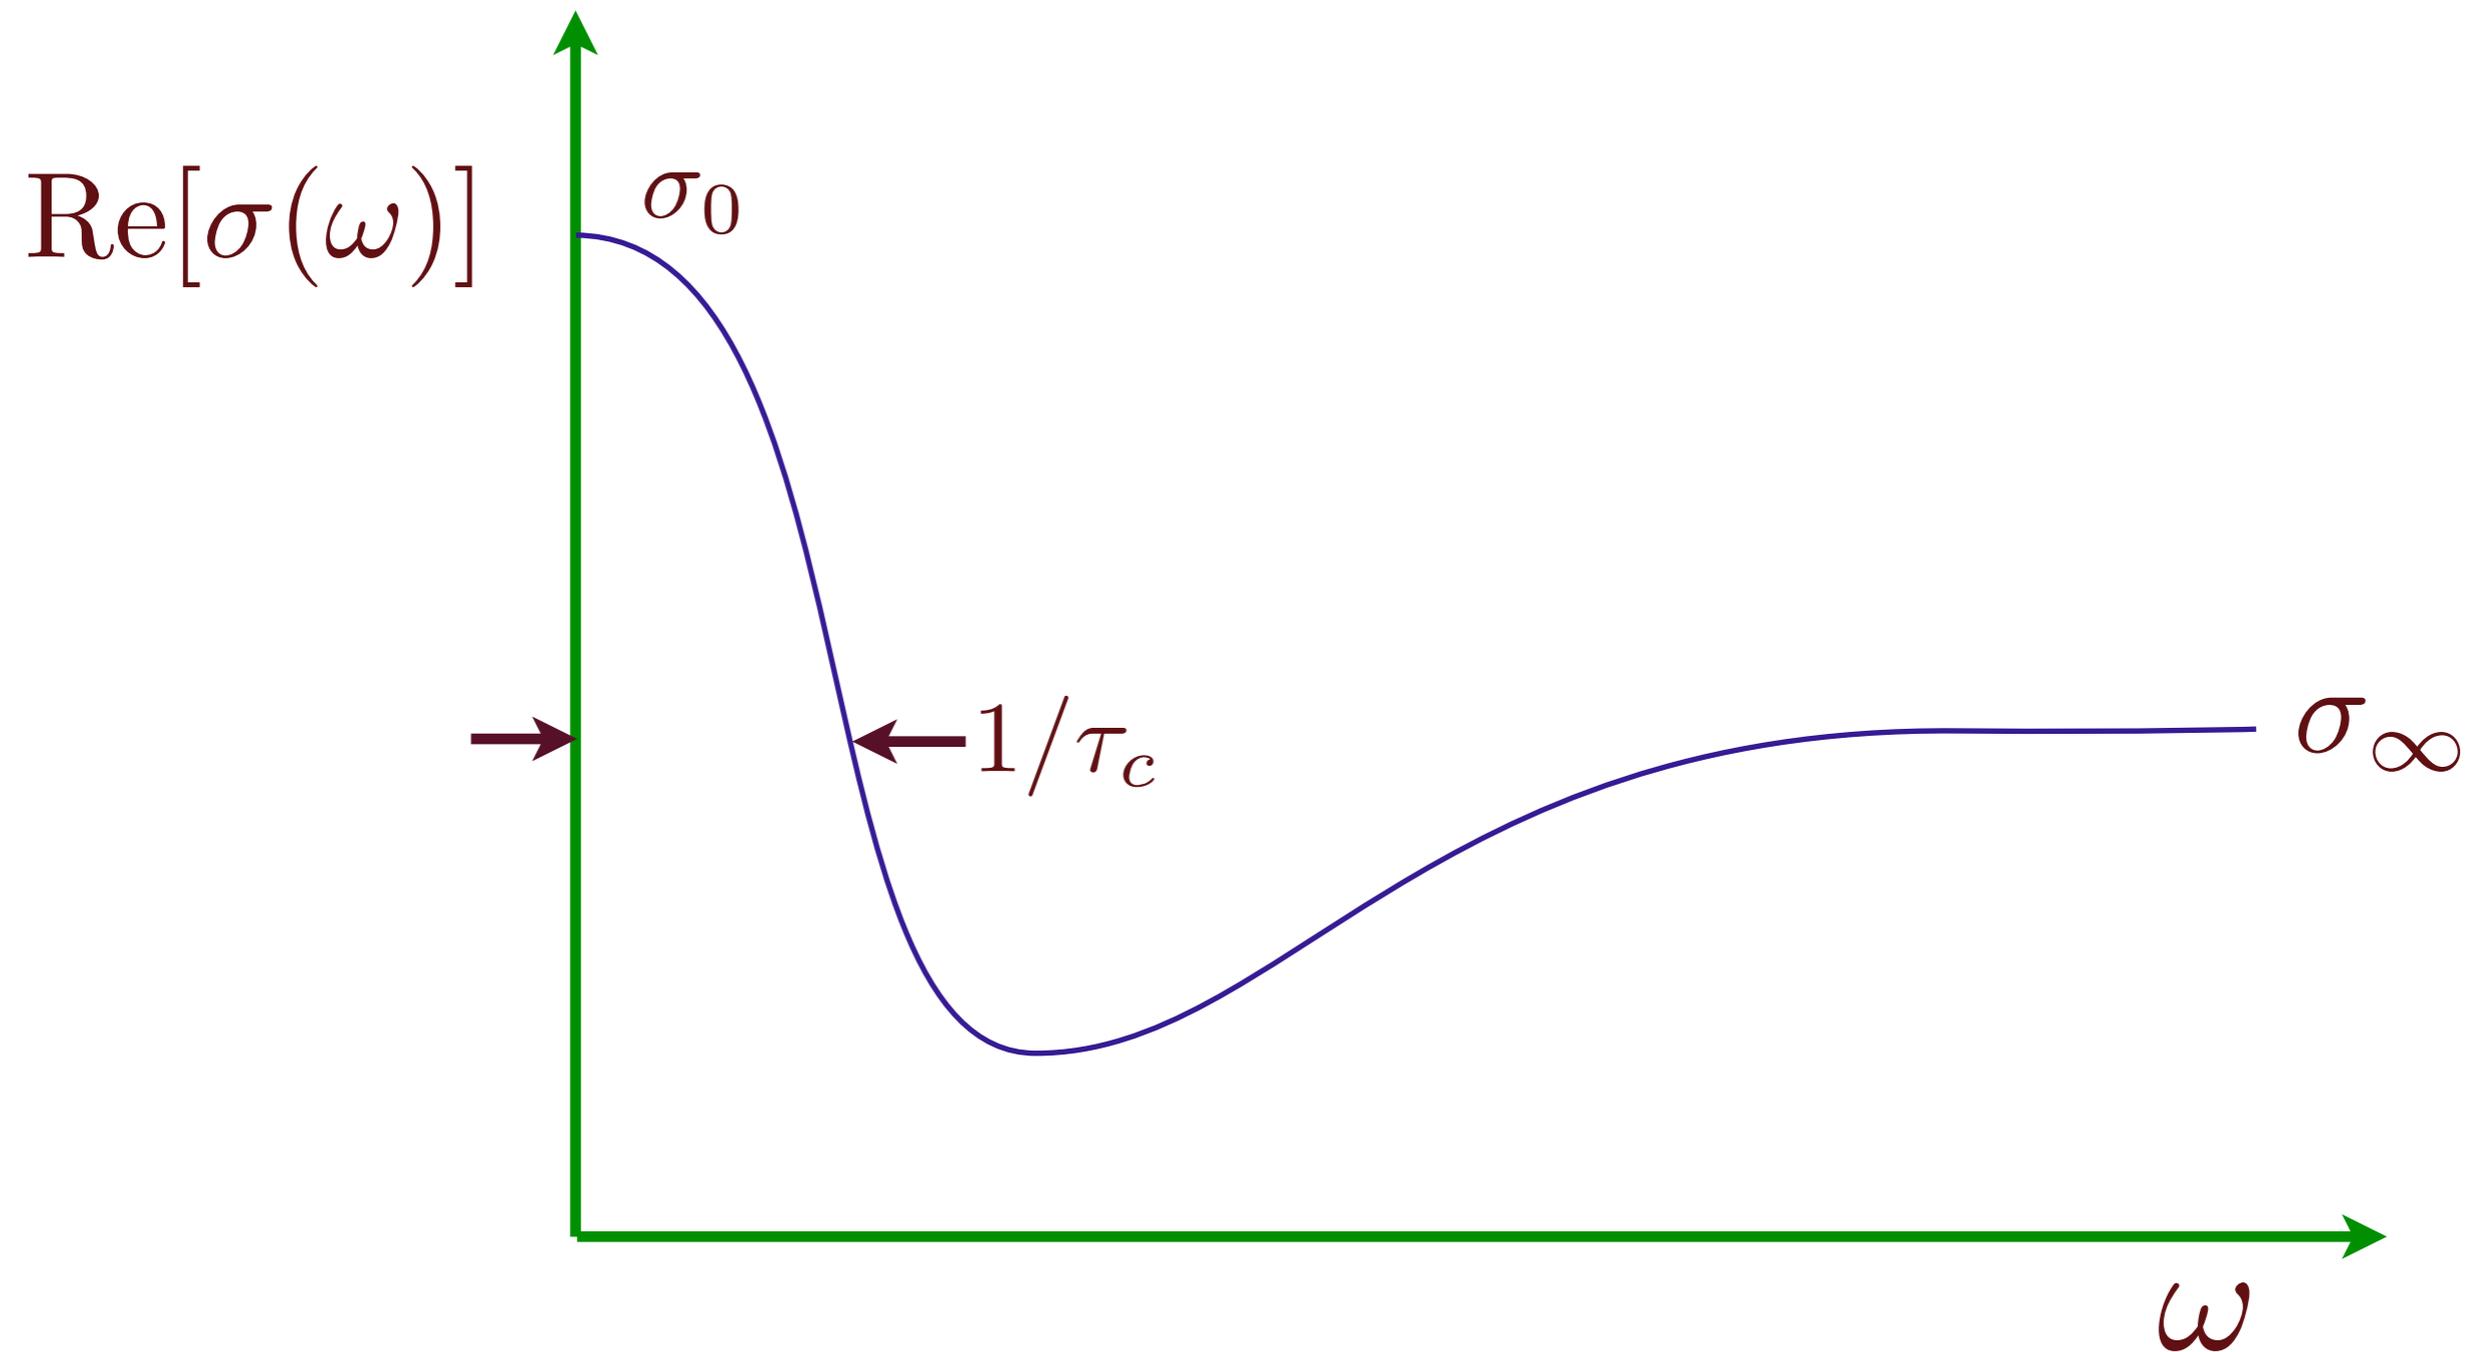

This gives a frequency ( $\omega$ ) dependent conductivity

$$\sigma(\omega) = \frac{\sigma_0}{1 - i\omega\tau_c}$$

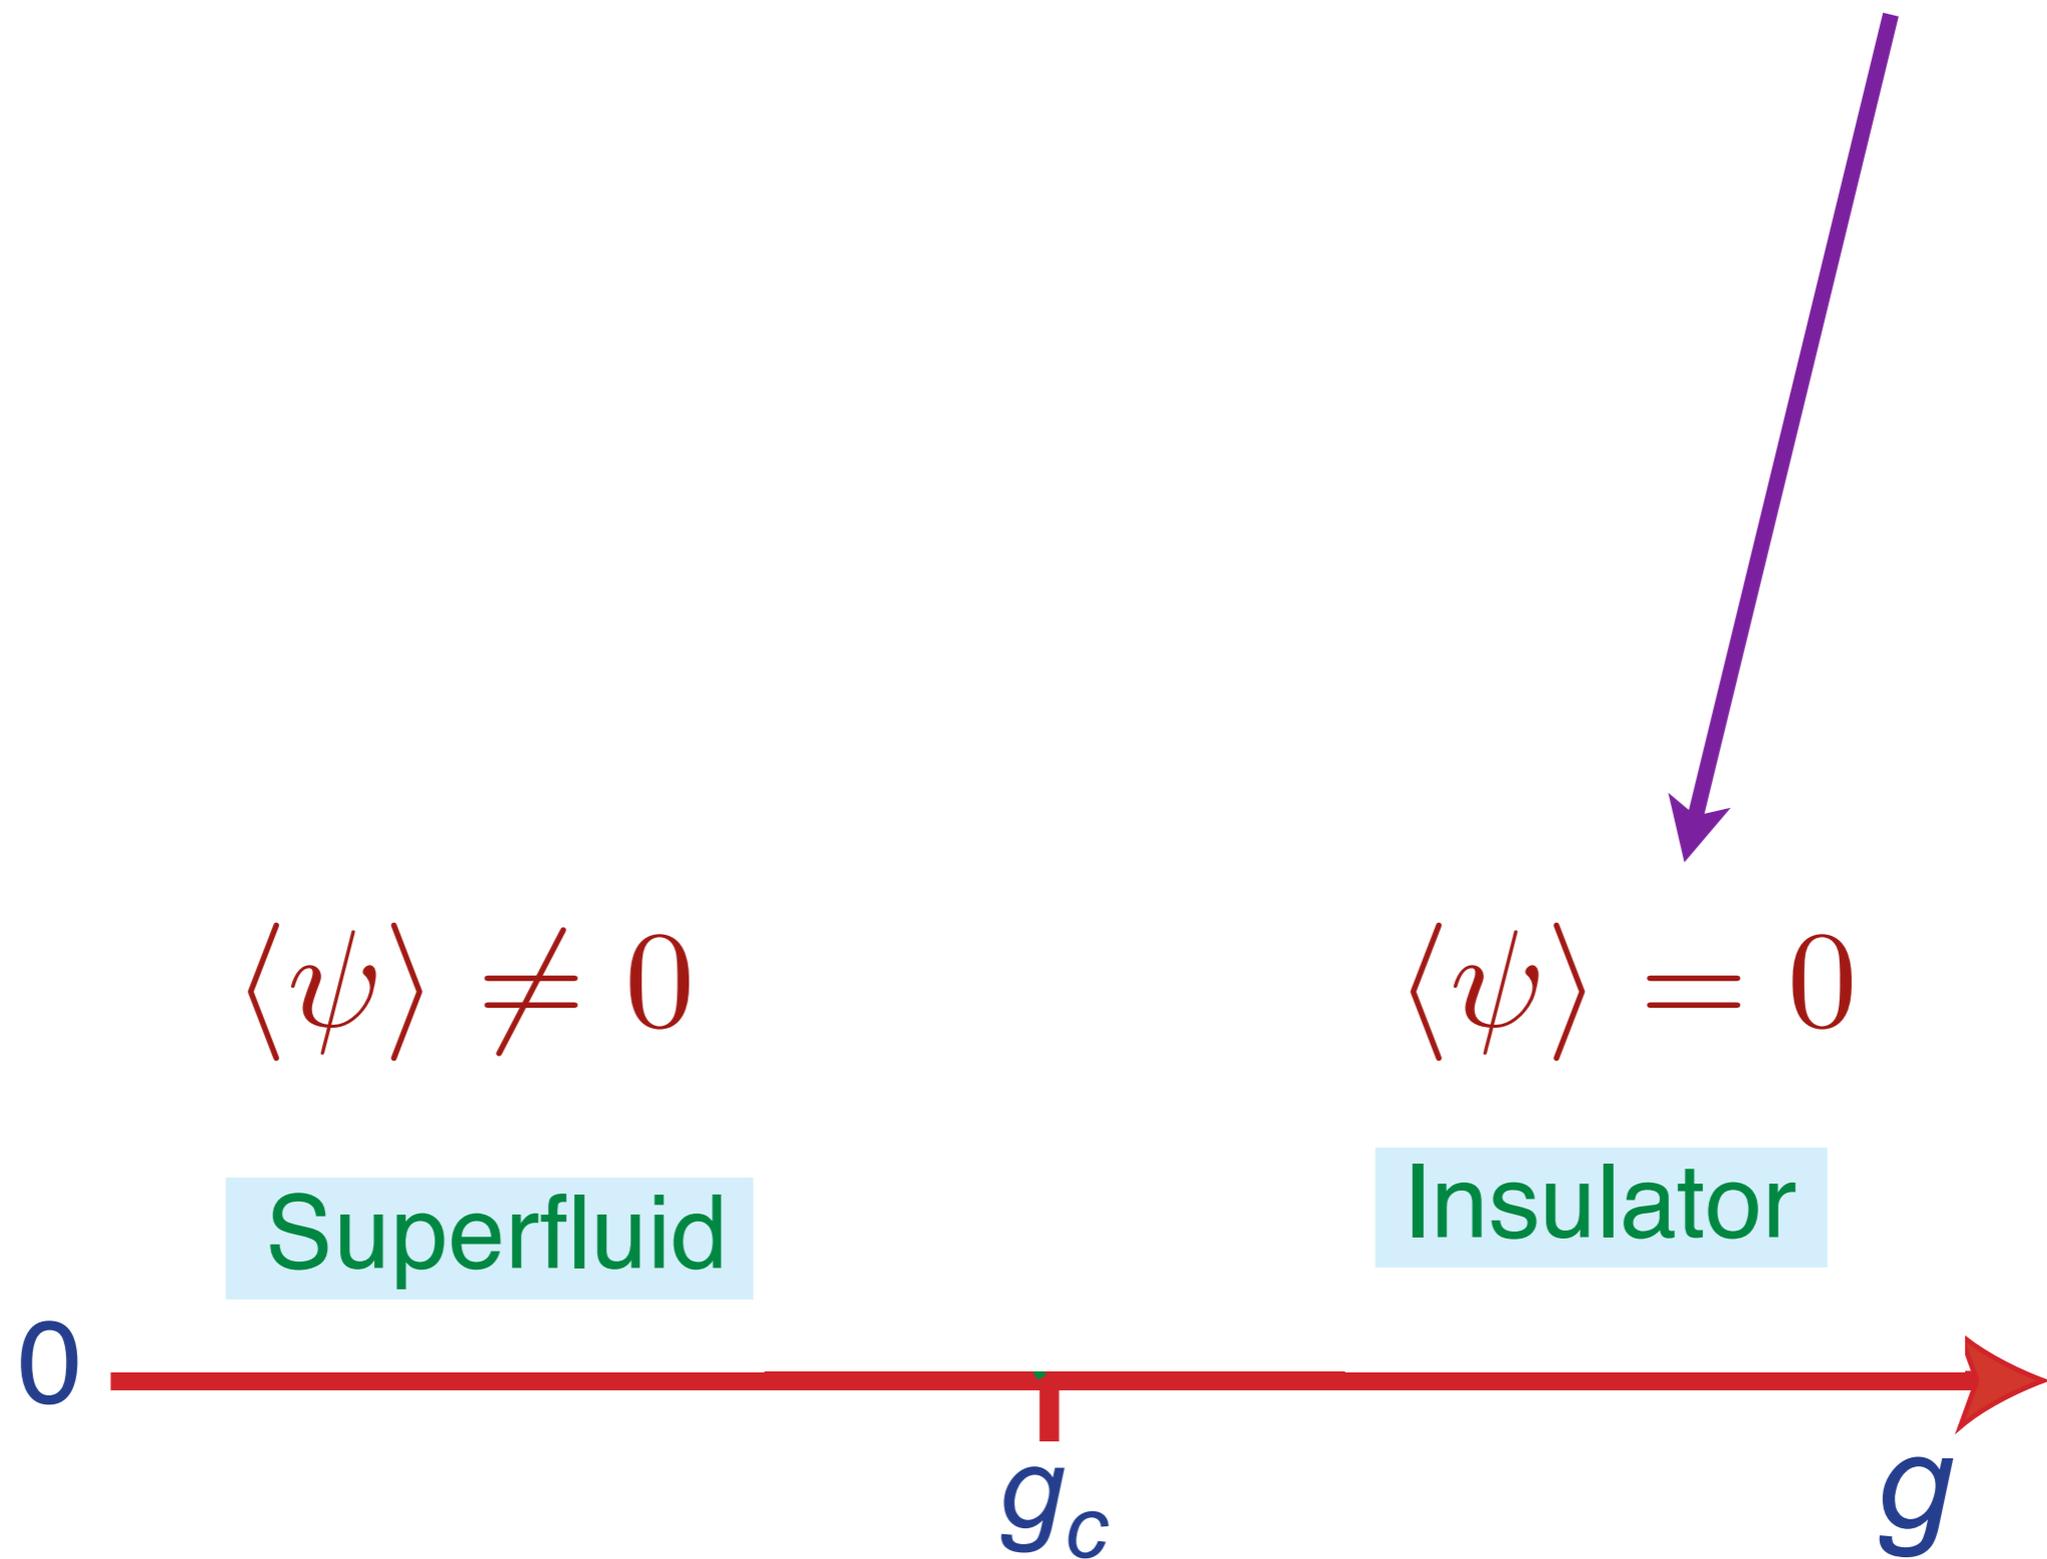

where  $\tau_c \sim \hbar/(k_B T)$  is the time between boson collisions.

Also, we have  $\sigma(\omega \rightarrow \infty) = \sigma_\infty$ , associated with the density of states for particle-hole creation (the “optical conductivity”) in the CFT3.

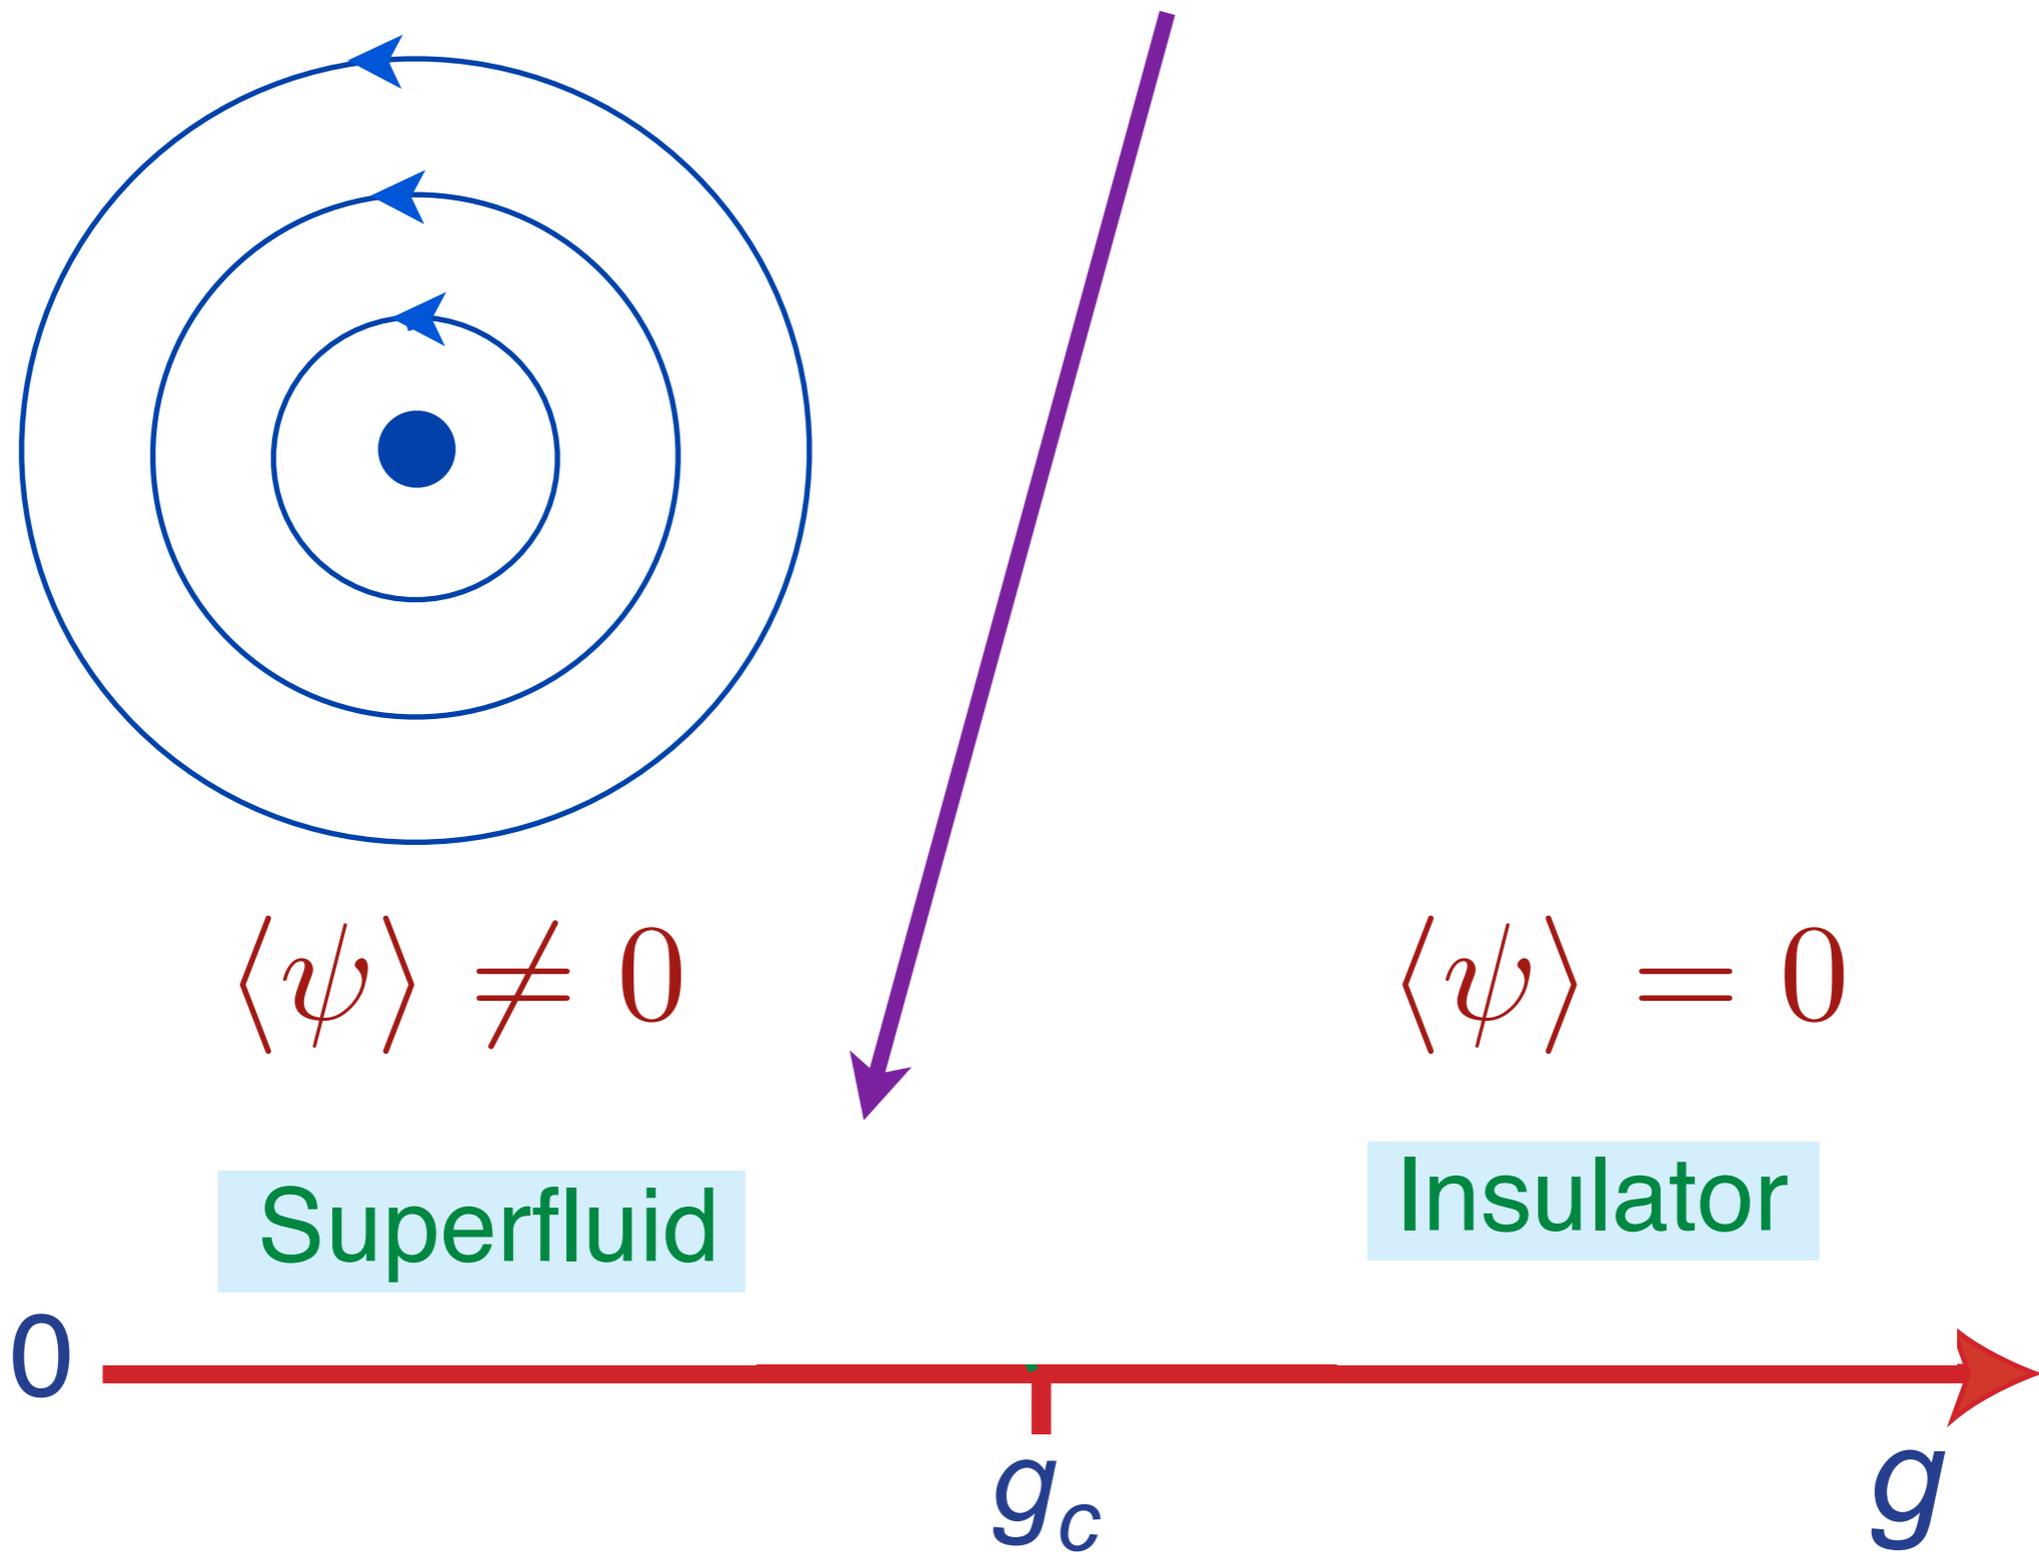

# Boltzmann theory of bosons

So far, we have described the quantum critical point using the boson particle and hole excitations of the insulator.

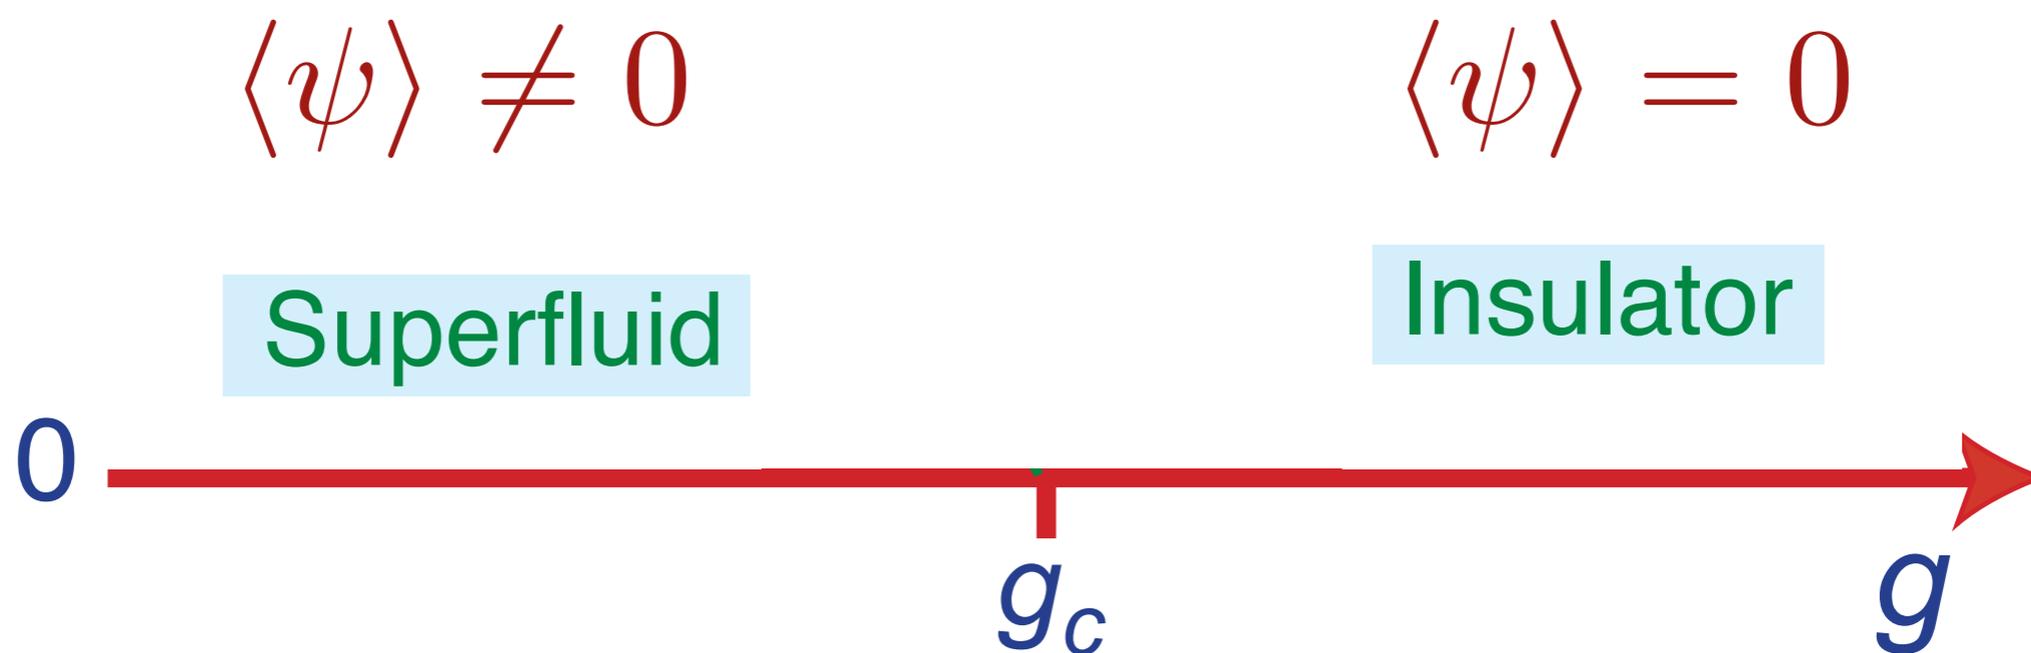

However, we could equally well describe the conductivity using the excitations of the superfluid, which are *vortices*.

However, we could equally well describe the conductivity using the excitations of the superfluid, which are *vortices*.

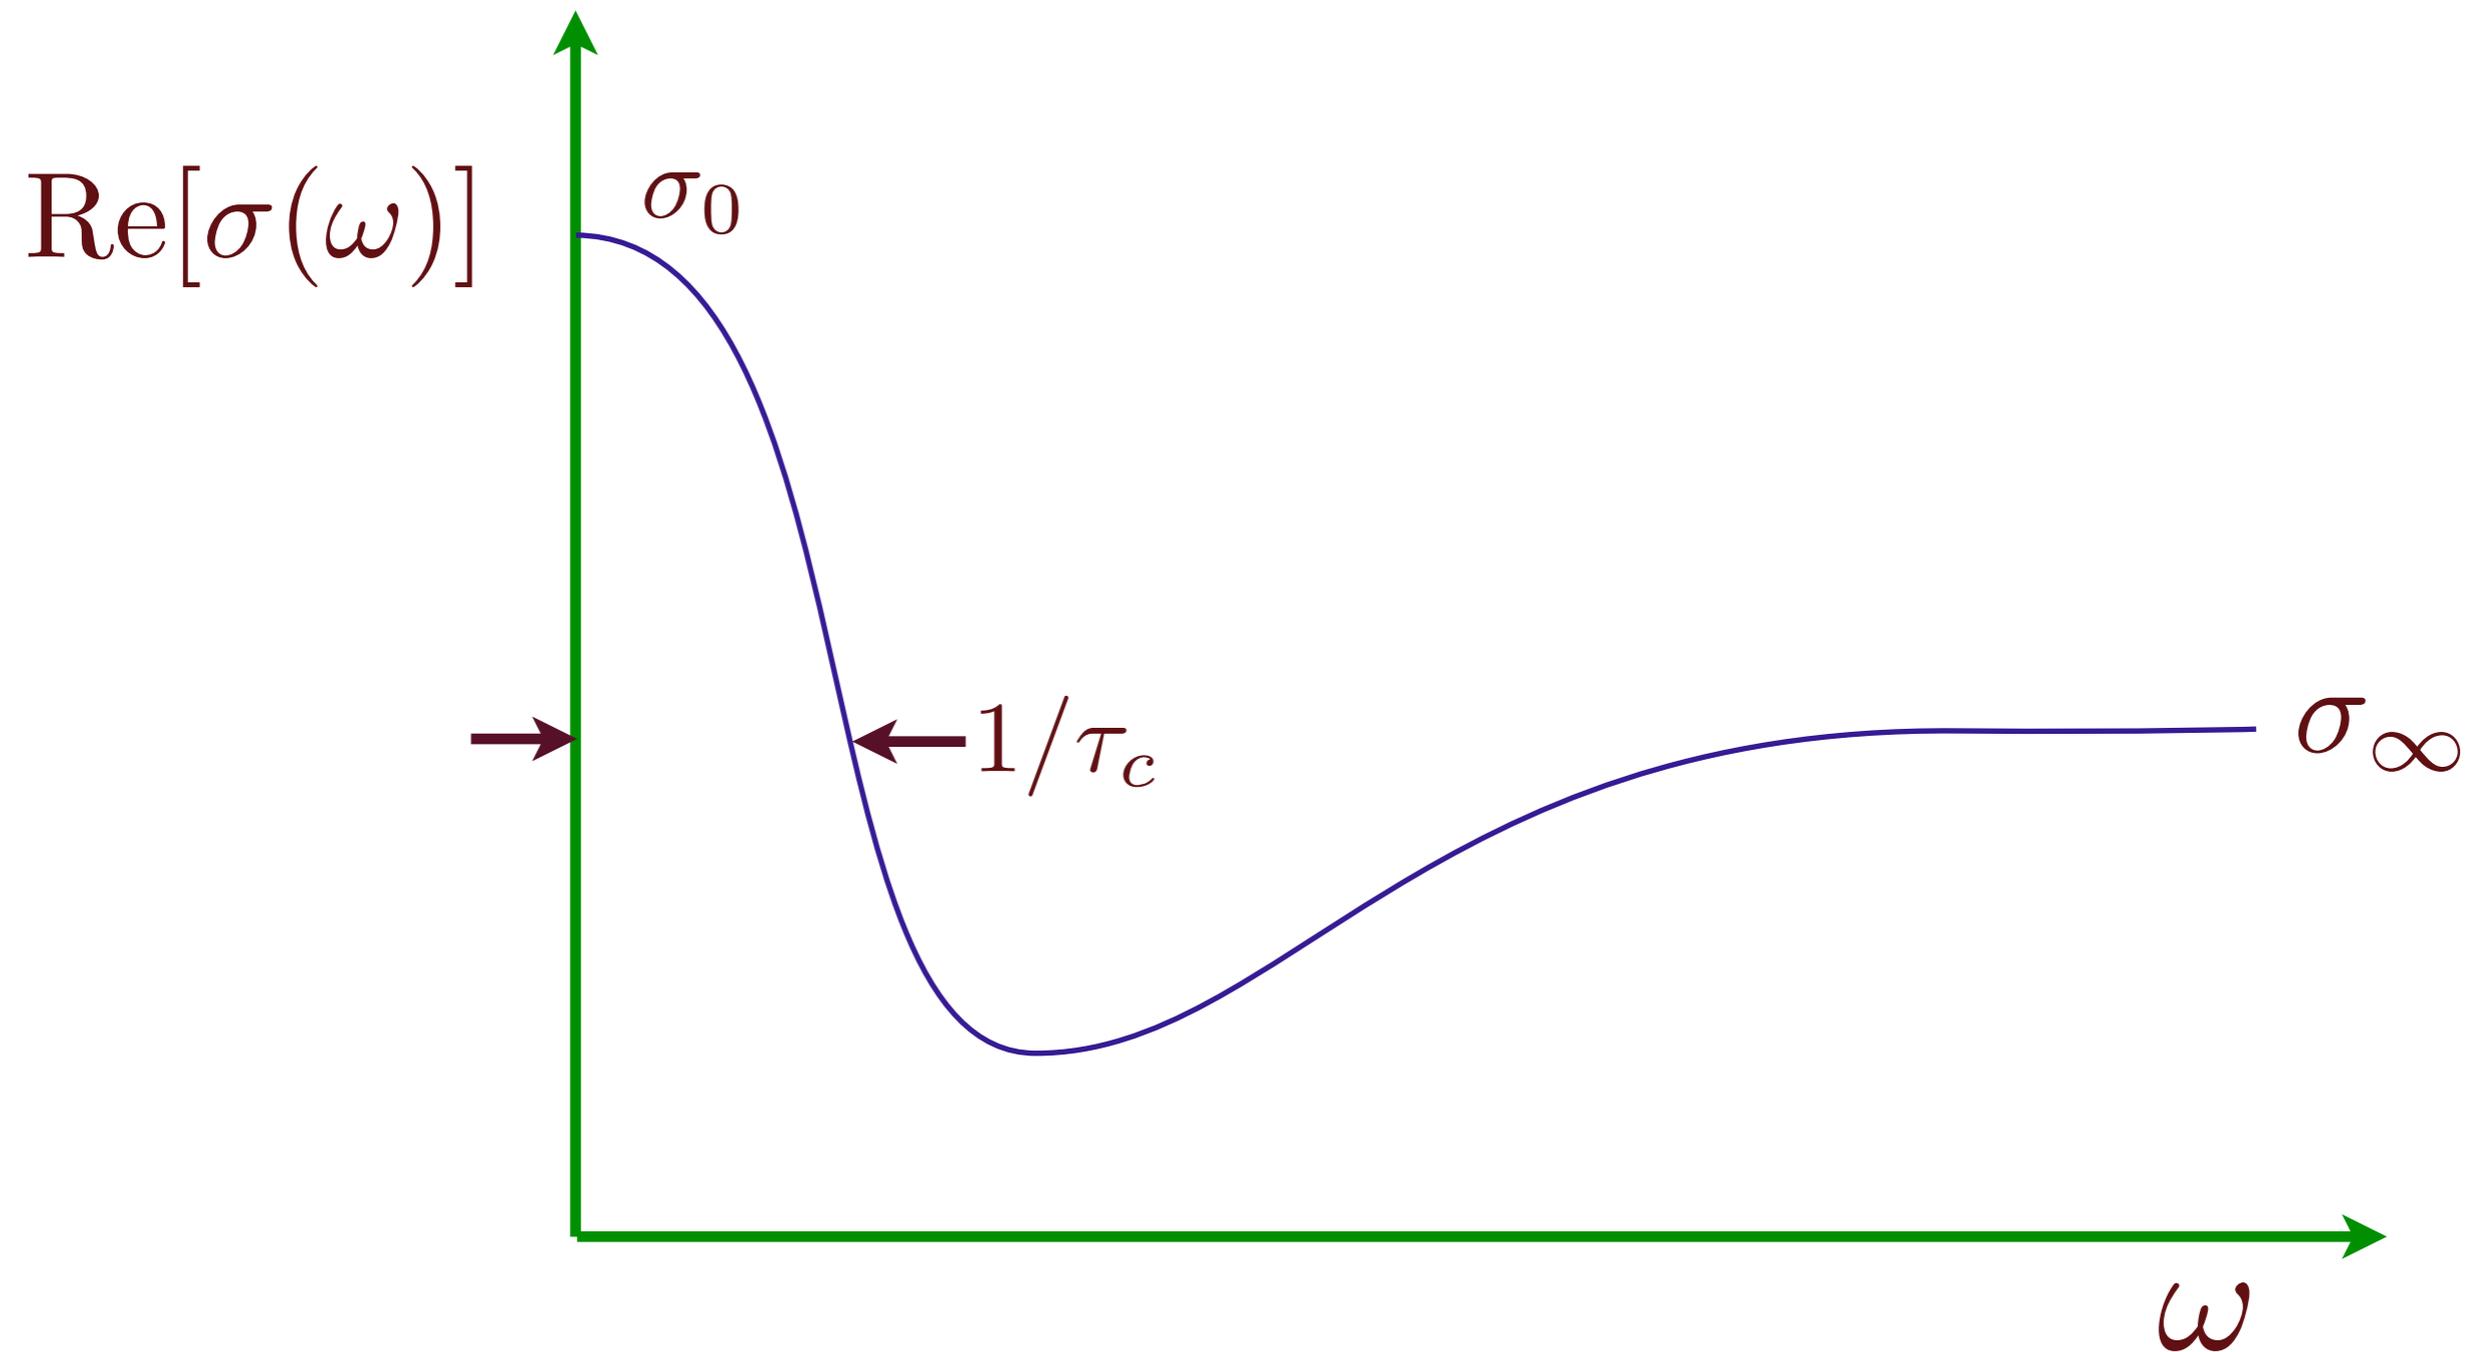

These are quantum particles (in 2+1 dimensions) which described by a (mirror/e.m.) “dual” CFT3 with an emergent U(1) gauge field. Their  $T > 0$  dynamics can also be described by a Boltzmann equation:

Conductivity = Resistivity of vortices

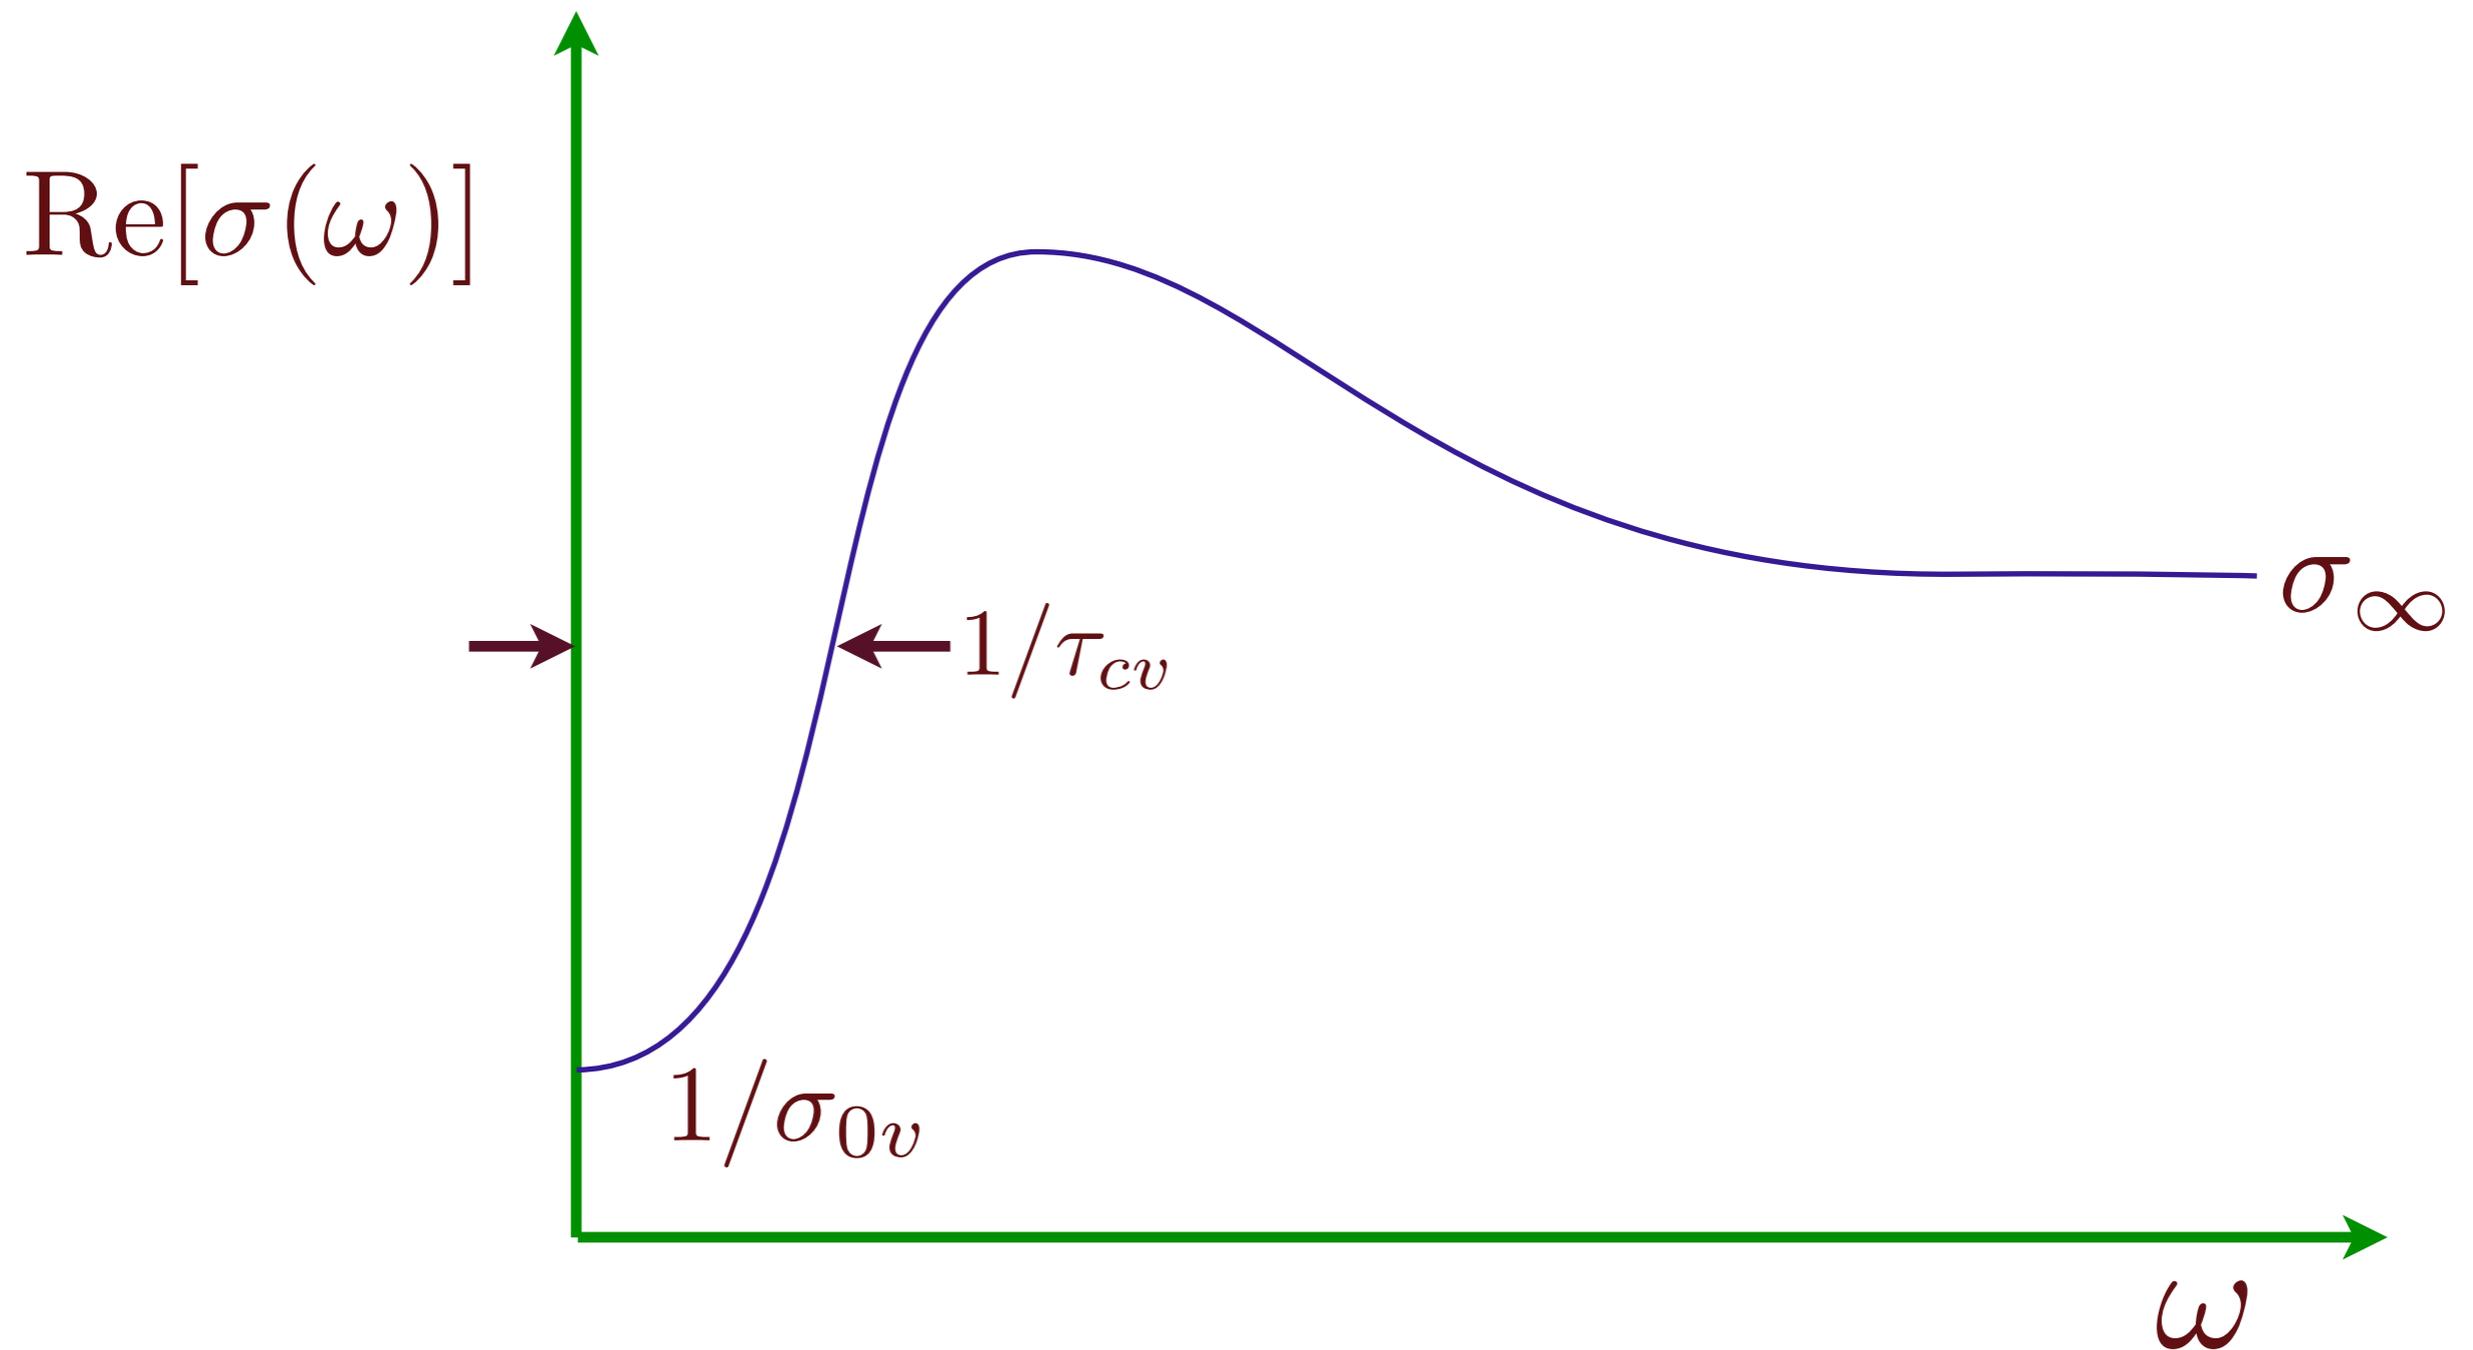

M.P.A. Fisher, *Physical Review Letters* **65**, 923 (1990)

3. Quantum criticality and conformal field theories
4. Holography and the quasi-normal modes of black-hole horizons

Field theories in  $d + 1$  spacetime dimensions are characterized by couplings  $g$  which obey the renormalization group equation

$$u \frac{dg}{du} = \beta(g)$$

where  $u$  is the energy scale. The RG equation is *local* in energy scale, *i.e.* the RHS does not depend upon  $u$ .

**Key idea:**  $\Rightarrow$  Implement  $r$  as an extra dimension, and map to a local theory in  $d + 2$  spacetime dimensions.

For a relativistic CFT in  $d$  spatial dimensions, the metric in the holographic space is uniquely fixed by demanding the following scale transformation ( $i = 1 \dots d$ )

$$x_i \rightarrow \zeta x_i \quad , \quad t \rightarrow \zeta t \quad , \quad ds \rightarrow ds$$

For a relativistic CFT in  $d$  spatial dimensions, the metric in the holographic space is uniquely fixed by demanding the following scale transformation ( $i = 1 \dots d$ )

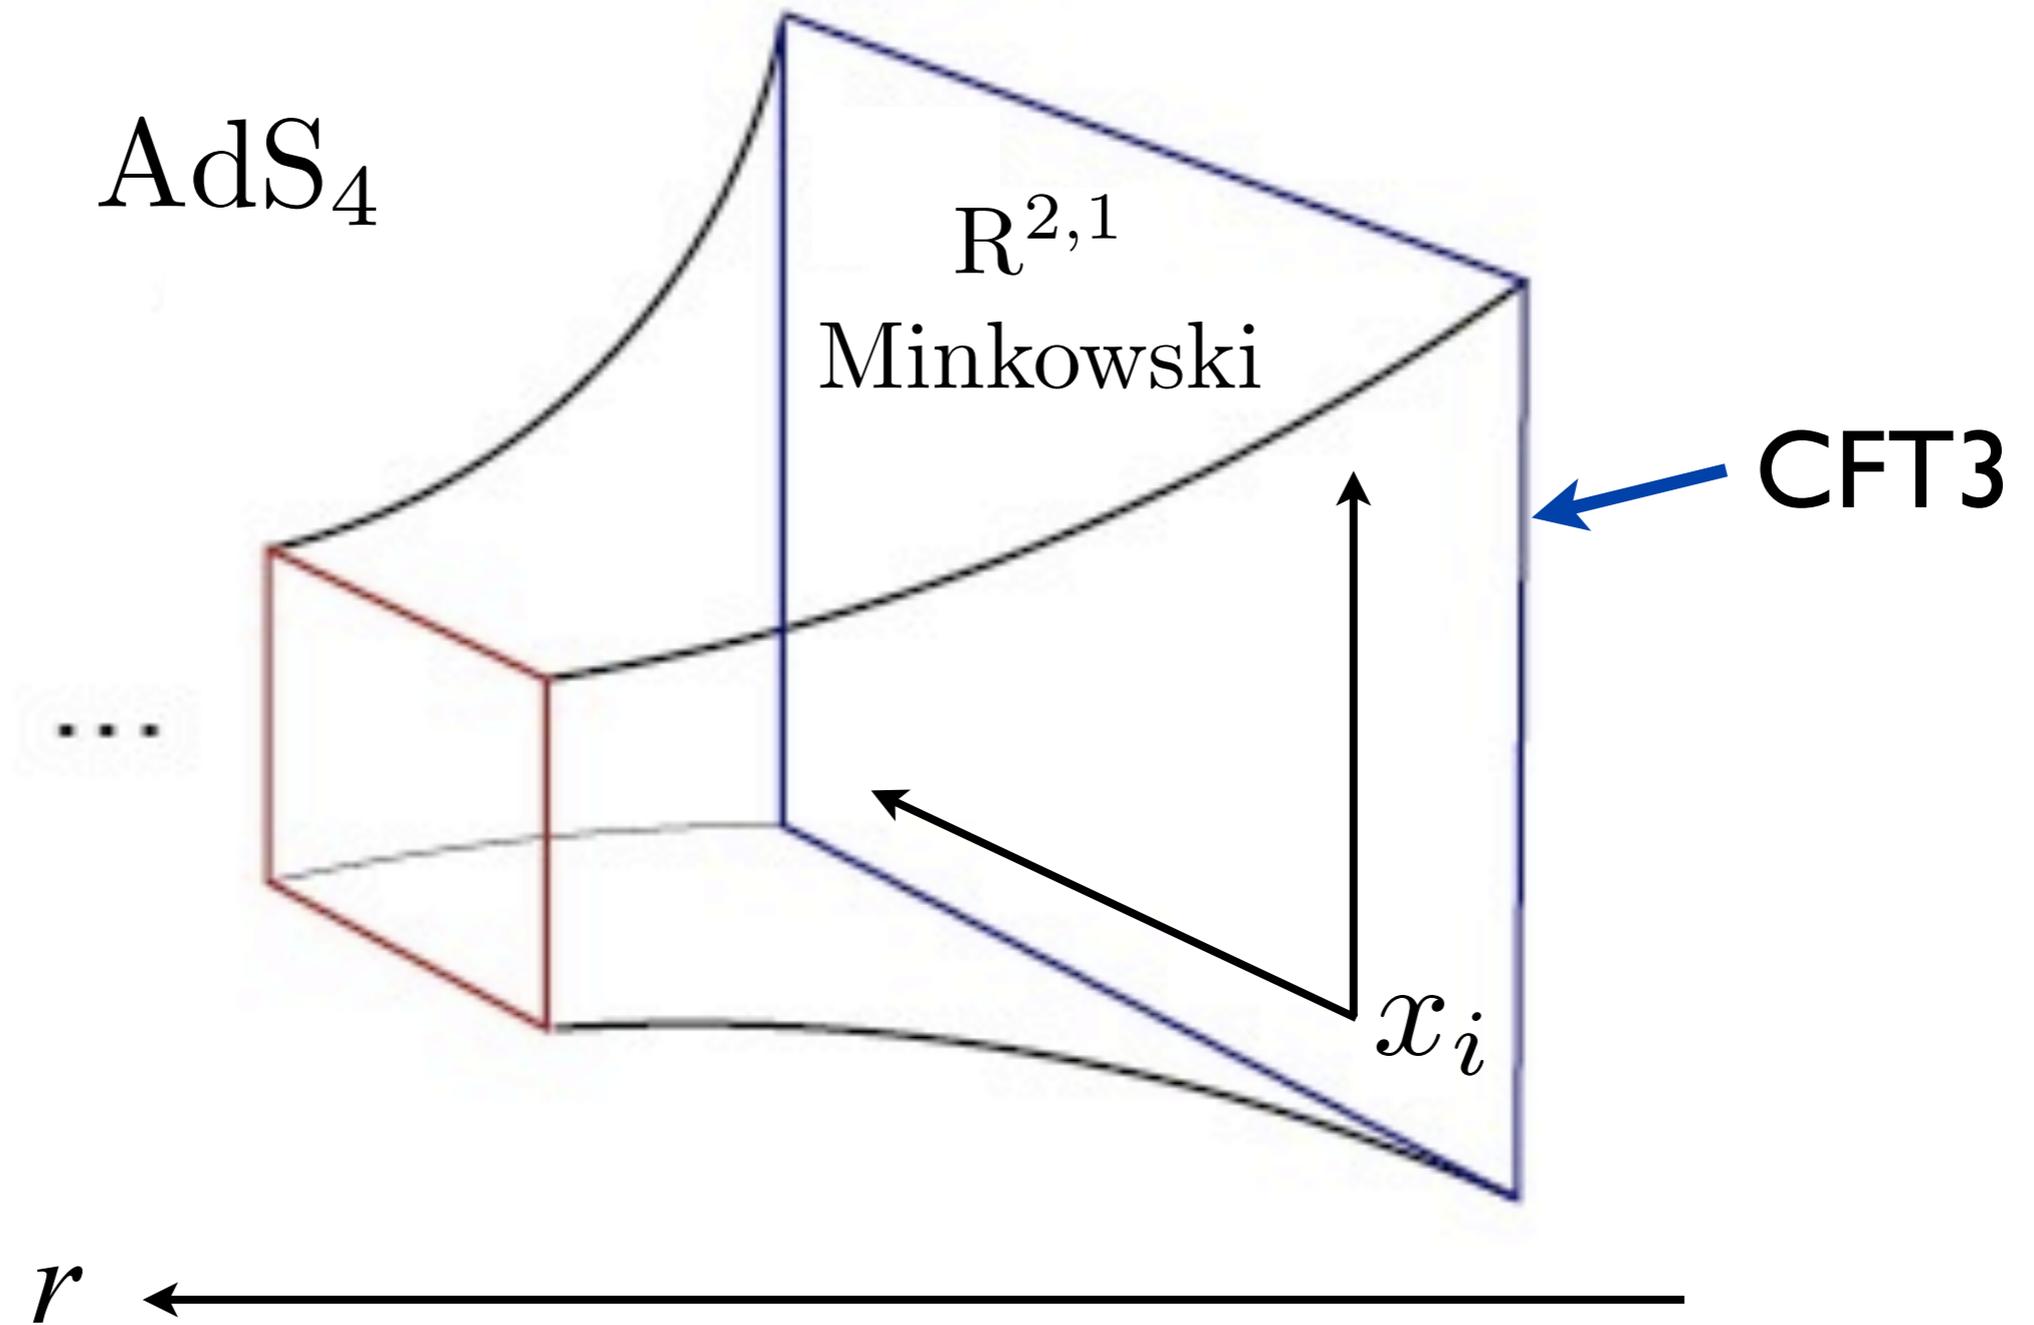

$$x_i \rightarrow \zeta x_i \quad , \quad t \rightarrow \zeta t \quad , \quad ds \rightarrow ds$$

This gives the unique metric

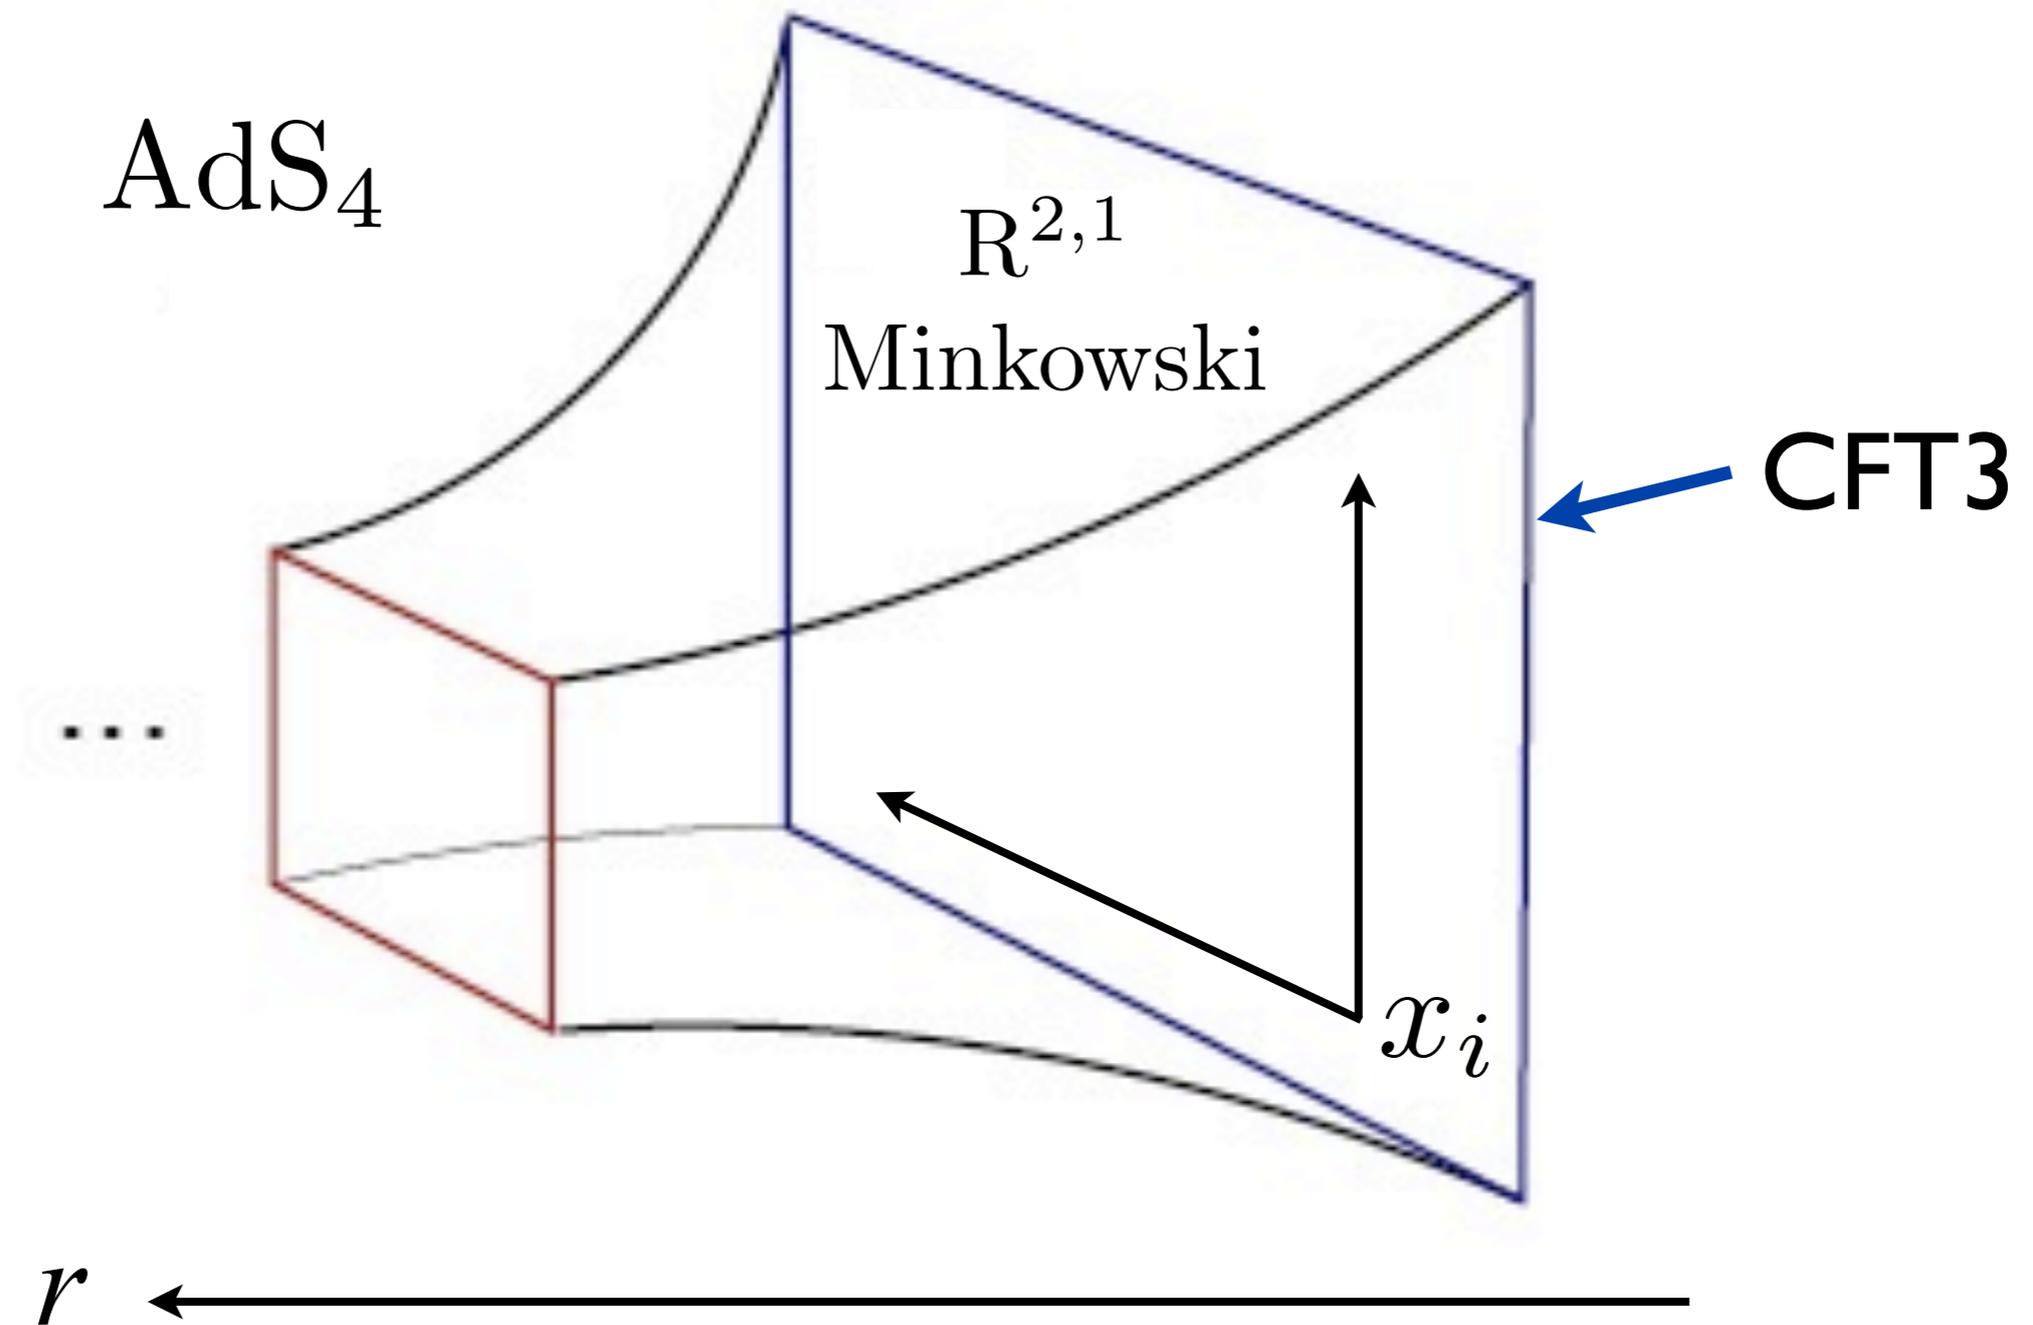

$$ds^2 = \frac{1}{r^2} (-dt^2 + dr^2 + dx_i^2)$$

Reparametrization invariance in  $r$  has been used to the prefactor of  $dx_i^2$  equal to  $1/r^2$ . This fixes  $r \rightarrow \zeta r$  under the scale transformation. This is the metric of the space  $\text{AdS}_{d+2}$ .

# AdS/CFT correspondence

# AdS/CFT correspondence

This emergent spacetime is a solution of Einstein gravity with a negative cosmological constant

$$\mathcal{S}_E = \int d^4x \sqrt{-g} \left[ \frac{1}{2\kappa^2} \left( R + \frac{6}{L^2} \right) \right]$$

## AdS/CFT correspondence

For every primary operator  $O(\mathbf{x})$  in the CFT, there is a corresponding field  $\phi(\mathbf{x}, r)$  in the bulk (gravitational) theory. For a scalar operator  $O(\mathbf{x})$  of dimension  $\Delta$ , the correlators of the boundary and bulk theories are related by

$$\langle O(\mathbf{x}_1) \dots O(\mathbf{x}_n) \rangle_{\text{CFT}} = Z^n \lim_{r \rightarrow 0} r_1^{-\Delta} \dots r_n^{-\Delta} \langle \phi(\mathbf{x}_1, r_1) \dots \phi(\mathbf{x}_n, r_n) \rangle_{\text{bulk}}$$

where the “wave function renormalization” factor  $Z = (2\Delta - D)$ .

## AdS/CFT correspondence

For a U(1) conserved current  $J_\mu$  of the CFT, the corresponding bulk operator is a U(1) *gauge* field  $A_\mu$ . With a Maxwell action for the gauge field

$$\mathcal{S}_M = \frac{1}{4g_M^2} \int d^{D+1}x \sqrt{g} F_{ab} F^{ab}$$

we have the bulk-boundary correspondence

$$\langle J_\mu(\mathbf{x}_1) \dots J_\nu(\mathbf{x}_n) \rangle_{\text{CFT}} = (Z g_M^{-2})^n \lim_{r \rightarrow 0} r_1^{2-D} \dots r_n^{2-D} \langle A_\mu(\mathbf{x}_1, r_1) \dots A_\nu(\mathbf{x}_n, r_n) \rangle_{\text{bulk}}$$

with  $Z = D - 2$ .

## AdS/CFT correspondence

A similar analysis can be applied to the stress-energy tensor of the CFT,  $T_{\mu\nu}$ . Its conjugate field must be a spin-2 field which is invariant under gauge transformations: it is natural to identify this with the change in metric of the bulk theory. We write  $\delta g_{\mu\nu} = (L^2/r^2)\chi_{\mu\nu}$ , and then the bulk-boundary correspondence is now given by

$$\langle T_{\mu\nu}(\mathbf{x}_1) \dots T_{\rho\sigma}(\mathbf{x}_n) \rangle_{\text{CFT}} = \left( \frac{ZL^2}{\kappa^2} \right)^n \lim_{r \rightarrow 0} r_1^{-D} \dots r_n^{-D} \langle \chi_{\mu\nu}(\mathbf{x}_1, r_1) \dots \chi_{\rho\sigma}(\mathbf{x}_n, r_n) \rangle_{\text{bulk}},$$

with  $Z = D$ .

## AdS/CFT correspondence

So the minimal bulk theory for a CFT with a conserved U(1) current is the *Einstein-Maxwell* theory with a cosmological constant

$$\mathcal{S} = \frac{1}{4g_M^2} \int d^4x \sqrt{g} F_{ab} F^{ab} + \int d^4x \sqrt{g} \left[ -\frac{1}{2\kappa^2} \left( R + \frac{6}{L^2} \right) \right].$$

This action is characterized by two dimensionless parameters:  $g_M$  and  $L^2/\kappa^2$ , which are related to the conductivity  $\sigma(\omega) = \mathcal{K}$  and the central charge of the CFT.

## AdS/CFT correspondence

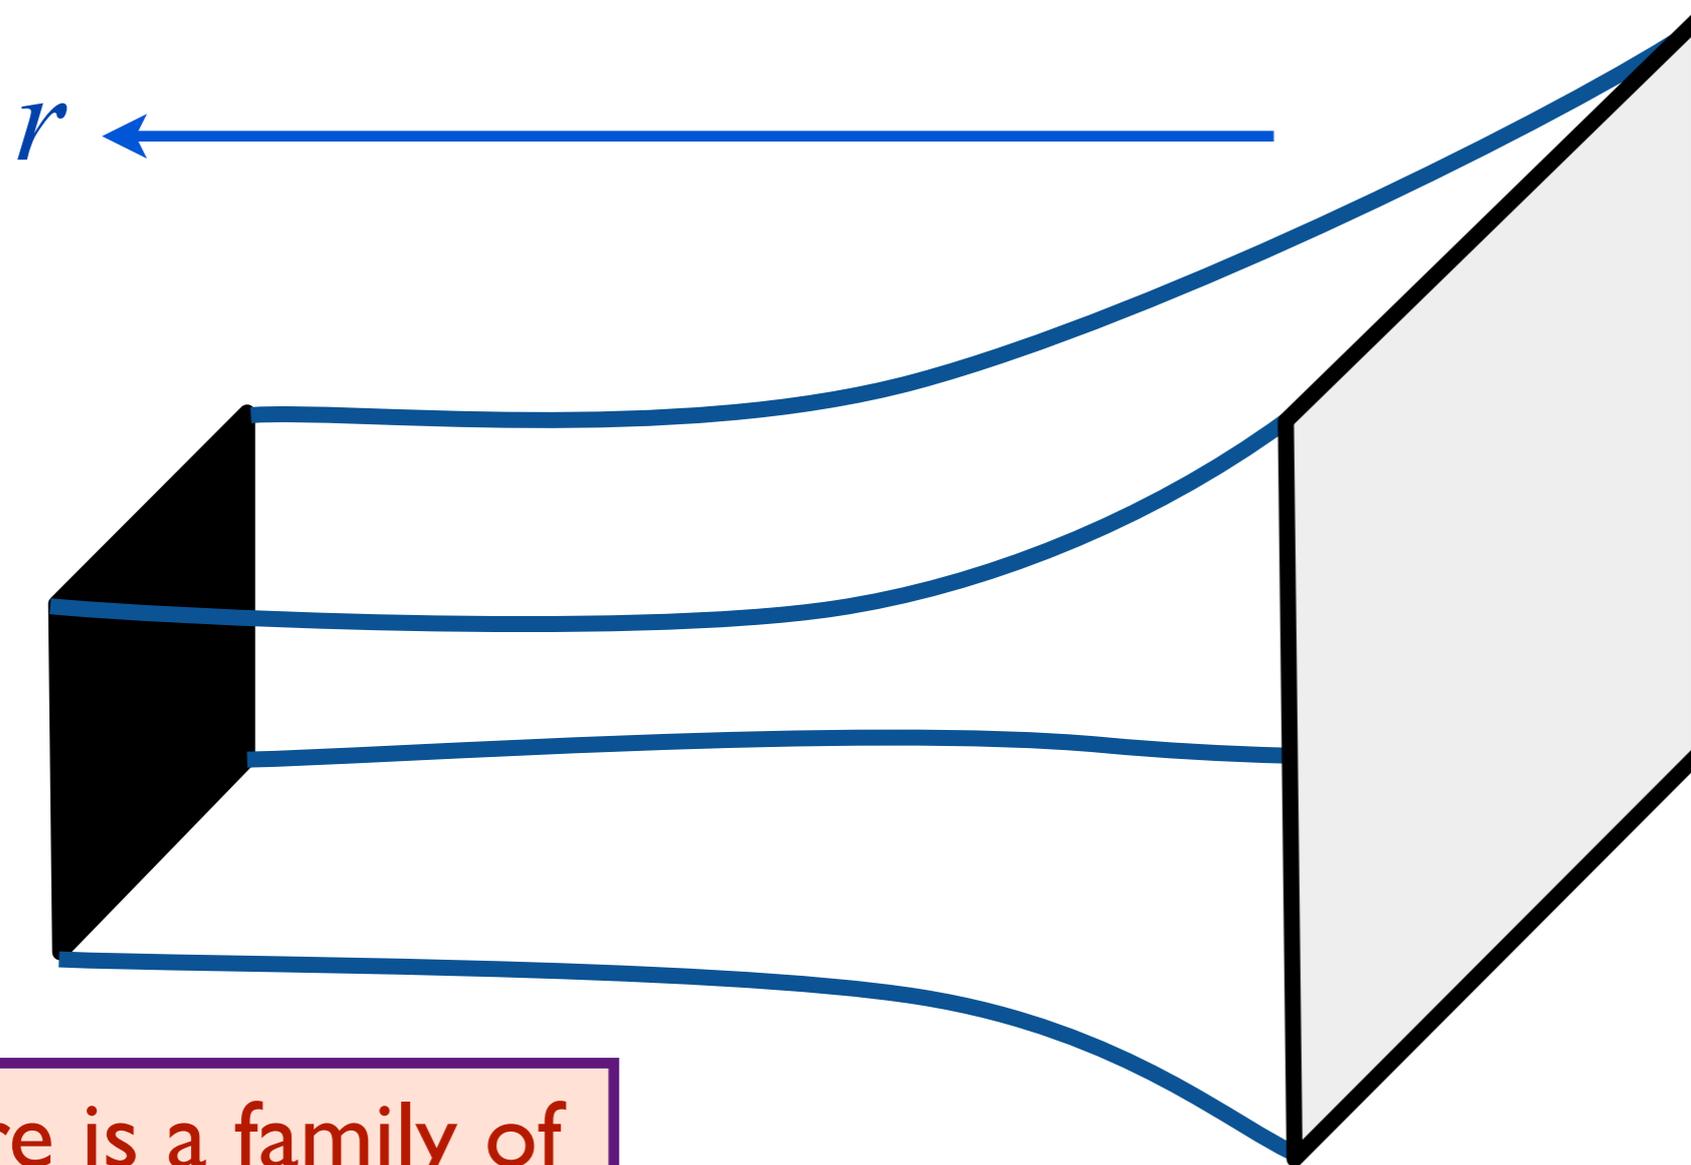

This minimal action also fixes multi-point correlators of the CFT: however these do not have the most general form allowed for a CFT. To fix these, we have to allow for higher-gradient terms in the bulk action. For the conductivity, it turns out that only a single 4 gradient term contributes

$$\mathcal{S}_{\text{bulk}} = \frac{1}{g_M^2} \int d^4x \sqrt{g} \left[ \frac{1}{4} F_{ab} F^{ab} + \gamma L^2 C_{abcd} F^{ab} F^{cd} \right] \\ + \int d^4x \sqrt{g} \left[ -\frac{1}{2\kappa^2} \left( R + \frac{6}{L^2} \right) \right],$$

where  $C_{abcd}$  is the Weyl tensor. The parameter  $\gamma$  can be related to 3-point correlators of  $J_\mu$  and  $T_{\mu\nu}$ . Both boundary and bulk methods show that  $|\gamma| \leq 1/12$ , and the bound is saturated by free fields.

# AdS<sub>4</sub> theory of quantum criticality

The holographic solutions for the conductivity satisfy two sum rules, valid for all CFT<sub>3</sub>s. (W. Witzack-Krempa and S. Sachdev, Phys. Rev. B **86**, 235115 (2012))

$$\int_0^{\infty} d\omega \operatorname{Re} [\sigma(\omega) - \sigma(\infty)] = 0$$
$$\int_0^{\infty} d\omega \operatorname{Re} \left[ \frac{1}{\sigma(\omega)} - \frac{1}{\sigma(\infty)} \right] = 0$$

The second rule follows from the existence of a EM-dual CFT<sub>3</sub>.

Boltzmann theory chooses a “particle” basis: this satisfies only *one* sum rule but not the other.

**Holographic theory satisfies both sum rules.**
